Executive Summary

This overheating report has been prepared by Whitecode Consulting Ltd on behalf of Regal Chalk Farm Limited ('the Applicant') in support of an application for full planning permission for the redevelopment of 100 Chalk Farm Road ('the Site') within London Borough of Camden ('LBC').

The description of development is as follows:

"Demolition of existing buildings and redevelopment of the site to provide two buildings containing purpose-built student accommodation with associated amenity and ancillary space (Sui Generis), affordable residential homes (Class C3), ground floor commercial space (Class E) together with public realm, access, servicing, and other associated works."

Policy SI 4 Managing Heat Risk of the London Plan requires that major developments reduce potential overheating through the cooling hierarchy, and reliance on air conditioning systems, through passive measures.

The following criteria is set out in CIBSE Technical Memorandum 59 – Design methodology for the assessment of overheating risk in homes (TM59:2017), for predominantly naturally ventilated rooms. Compliance is based on passing both criteria below.

Criterion 1 - for living rooms, kitchens and bedrooms

• A limit is set for the number of hours that the operative temperature can exceed the maximum adaptive temperature. A temperature difference greater than or equal to 1K shall not exceed 3% of the occupied hours of a typical summer (1st May to 30th September).

Criterion 2 - for bedrooms only

• To guarantee comfort during the sleeping hours the operative temperature in the bedroom from 10pm to 7am shall not exceed 26°C for more than 1% of annual hours (1% of the annual hours between 10pm to 7am for bedrooms is 32 hours).

Homes which have restricted window openings, due to noise or pollution reasons, must be assessed against the CIBSE fixed temperature test.

CIBSE fixed temperature test

·All occupied rooms should not exceed an operative temperature of 26°C for more than 3% of the annual occupied hours

Integrated Environmental Solutions Virtual Environmental (IES VE) software, version 2022.2.0.0, was used to assess the dwellings using the latest CIBSE Design Summer Year (DSY1) weather file for London Gatwick, for the 2020s, high emissions, 50% percentile scenario.

This site has been assessed by a qualified acoustician and the report recommends that bedroom windows in both the PBSA and residential block are shut overnight for acoustic reasons. Part O allows bedroom windows to be open during the day, and living room windows day and night, providing security measures are met.

In line with the cooling hierarchy the scheme fully complies with passive measures alone when no acoustic constraints are assumed. These passive measures are; low g-value glazing, deep reveals, and external shading from fins and balconies.

Where windows are unable to open, either due to acoustic or security reasons, MVHR with tempered air has been proposed to mitigate the overheating risk. The flow rates are detailed further in this report.

Option	Compliance w
Passive measures alone	Full Complian
With acoustic constraints	Full Complian

CIBSE TM59:2017 recommends that the risk of summer overheating is assessed in common areas where community heating pipework runs through them. There is no mandatory target to meet for common areas, but if

an internal operative temperature of 28°C is exceeded for more than 3% of the total annual hours then this should be identified. 3% of the total annual hours is 262 hours.

The London Plan requires the common commercial areas to be assessed against CIBSE TM52. CIBSE guide TM52, entitled The Limits of Thermal Comfort: Avoiding Overheating in European Buildings', contains guidance on the limits of thermal comfort. This provides guidance on predicting overheating in buildings. It is intended to inform designers, developers, and others responsible for defining the indoor environment in buildings and should be considered when carrying out dynamic thermal modelling.

The results for the commercial areas show they are compliant against the TM52 criteria, with cooling added.

1. Introduction

The purpose of this report is to show how the client can address the risk of overheating in the student accommodation and residential dwellings at 100 Chalk Farm Road, Camden.

1.1. Planning Policy and Regulations

The National Planning Policy Framework (NPPF) was updated in December 2023, which re-emphasises the Government's commitment to sustainable development and states the need for planning authorities to take an approach based on integrating the four aims of sustainable development.

Planning Policy is the Camden Local Plan 2017.

PLAN

The London Plan requires the common areas to be assessed against CIBSE TM52. CIBSE guide TM52, entitled 'The Limits of Thermal Comfort: Avoiding Overheating in European Buildings', contains guidance on the limits of thermal comfort. This provides guidance on predicting overheating in buildings. It is intended to inform designers, developers, and others responsible for defining the indoor environment in buildings and should be considered when carrying out dynamic thermal modelling.

The proposed development lies in the London Borough of Camden; therefore, the

applicable Regional Spatial Strategy is the London Plan (March 2021) and the Local

Policy SI 4 requires all major development proposals to demonstrate through an

energy strategy how they will reduce the potential for internal overheating and reliance

on air conditioning systems in accordance with the cooling hierarchy.

The policy below relates to mitigation of the impacts of climate change.

- > Policy CC1: Climate change adaptation
- ▶ Policy CC2: Climate change mitigation

HM Government

The results of the Part O assessment has implications on window design, openings and MEP design.

THE SPATIAL DEVELOPMENT STRATEGY FOR GREATER LONDO **MARCH 2021**

Part O of the Building Regulations. Planning applications approved after 15th June 2022, and all projects commencing construction after 15th June 2023 will need to demonstrate compliance with CIBSE TM59 methodology

Part O refers to TM59 for guidance when carrying out thermal modelling of a dwelling but goes on to set limits against the identified risk that the design methodology produces. A key difference between TM59 and Part O is that the new regulation will not allow for the effect of internal blinds to be considered when assessing the risk of overheating, nor will dynamic shading be deemed acceptable. Only fixed and passive shading devices are compliant. Additionally, there are slightly different requirements on how the openings should be modelled.

1.2. Overheating in dwellings

There are many factors that will determine indoor summer temperatures in dwellings in the UK. These factors include the following:

Current modelling-based evidence suggests that the South of the UK is likely to face the largest risk of indoor overheating. It was suggested that comfort targets will not be met in naturally ventilated buildings in London by the middle of the century without some form of mechanical cooling unless some additional adaption measures are carried out (CIBSE 2005). In contrast, it was estimated that Manchester and Edinburgh buildings will only encounter minor overheating problems within the same time frame.

An unintended consequence of improved building fabric of newly built dwellings may be an increased risk of overheating. Newly constructed highly insulated dwellings were found to have the potential to be at higher risk of overheating than older, less insulated dwellings.

There are a variety of methods that can be used to reduce the risk of indoor overheating and are split into what can be regulated and what cannot be regulated. These are shown in the tables below:

	What can be regula
Air movement	Moving air feels a
Insulation	Insulation is usually c thermos flask can ke can help homes stay c

it's cooler outside than inside, especially at night.

or shutters during the day, or use awnings to shade the glazing.

eiling fans to create a cooling breeze.

1.3 TM59 Thermal Design Criteria

The following criteria is set out in CIBSE Technical Memorandum 59 – Design methodology for the assessment of overheating risk in homes (TM59:2017), for predominantly naturally ventilated rooms. Compliance is based on passing **both** criteria below.

Criterion 1 - for living rooms, kitchens and bedrooms

• A limit is set for the number of hours that the operative temperature can exceed the maximum adaptive temperature. A temperature difference greater than or equal to 1K shall not exceed **3%** of the occupied hours of a typical summer (1st May to 30th September).

Criterion 2 - for bedrooms only

• To guarantee comfort during the sleeping hours the operative temperature in the bedroom from 10pm to 7am shall not exceed 26°C for more than 1% of annual hours (1% of the annual hours between 10pm to 7am for bedrooms is **32 hours**).

CIBSE TM59:2017 states that "the inclusion of corridors in the overheating analysis is mandatory where community heating pipework runs through them". There is no mandatory target to meet for common areas, but if an internal operative temperature of 28°C is exceeded for more than 3% of the total annual hours then this should be identified. 3% of the total annual hours is 262 hours.

2. The Development

The site will provide 265 student accommodation units, together with 824 sqm (GIA) of commercial space, 24 affordable residential units, with public realm improvements, new areas of landscaping, amenity and play space, and improved accessibility to the site.

The site is located on the south-western side of Chalk Farm Road and borders the mainline railway into Euston, with the Juniper Crescent Housing Estate to the south. It lies within the Regents Canal Conservation Area, to which the existing building on the site is a neutral contributor. To the west, the site is adjacent to the Grade II* listed Roundhouse theatre and live music venue. Beyond that, to the north-west is Chalk Farm Underground Station. To the east is the Petrol Filling Station site, which forms part of the Camden Goods Yard development and is currently in use as a temporary supermarket.

A sample of the dwellings have been investigated across a number of different levels and orientations. These are representative of all unit types in the scheme, and consider worst case scenarios.

Figure 2.1 100 Chalk Farm Site Plan

2.1. Site Constraints

There are acoustic constraints on the site which will require bedroom windows to remain shut overnight for overheating purposes. The results of the acoustic report produced by Sandy Brown Acoustics indicate there are facades which must be shut overnight in line with Part O guidance.

Areas on the ground floor will require to be fixed overnight due to security issues

Figure 2.2 100 Chalk Farm Acoustic Constraints

Figure 2.2 shows the façades which are over the limits for the simplified assessment method set out in Approved Document O highlighted, all facades exceed the requirement and therefore bedroom windows must be shut during the night.

This has been incorporated into the overheating model, all bedroom windows are not openable for overheating purposes overnight.

mark op key	A - Luna 80 - 85 dB	L. 65-70 dB
_	B - Luna 75 - 80 dB	L., 60-65 dB
-	C - L _{max} 70 - 75 dB	L ₄₄ 55-60 dB
-	D - Lavan \$ 70 dB	L _{ave} ≤ 55 dB

3. Orientation

The orientation of the building can have a big effect on the solar gains within a dwelling. South facing facades are more likely to overheat in the summer months as they are subject to the sun for longer periods of the day. East and West facades also are subject to the sun, the East facing in the morning, and the West in the afternoon. This means that they are also subject to solar gain during the day. The North façade will have little exposure to the sun; therefore, will not suffer from solar gains. The sun path diagram below confirms the above:

Figure 3.1 Sun-path Diagram

4. The Model

A dynamic 3D model of 100 Chalk Farm Lane development was completed.

To calculate the internal operative temperatures of the dwellings and common areas at different times of day, a model was built using Integrated Environmental Solutions Virtual Environment (IES VE) software, version 2022.2.0.0. This model takes into account a range of issues that could have an impact on the building's performance, including building fabric, orientation and external conditions.

The first stage of building the model was to produce a 2D template of each floor being assessed. The templates were created using floor plans issued by DSDHA.

Figure 4.1 2D Layout

The next stage was to use the templates in IES VE and elevations issued by DSDHA to create the 3D model of each floor culminating in the complete model as shown below:

Figure 4.2 3D Layout

The rooms shown in Figure 4.2 and 4.3 were modelled to give a good indication of the thermal make-up of the building. This enables an accurate range of internal operative temperatures to be obtained allowing reasonable conclusions for this development to be given. The local shading and adjacent buildings were modelled for shading purposes.

4.1. Building Fabric

The following building fabric specification was used for the thermal model, based on information taken from the buildups provided by Rock Townsend.

Element	Thermal Transmittance (W/m²K)
Exposed Floor	0.12
External Wall	0.15
Common Area Wall	0.18
Roof	0.12
Glazing	0.8/1.20
Internal Front Doors	1.10

Table 4.2 Building Fabric U-values

The glazing g-value is 0.40 to all areas. This allows it to let a good amount of solar gain into the rooms, without causing a large overheating effect. Any lower could affect lighting levels in the room, and cause for more artificial lighting to be used. The building's thermal mass is assessed and factored into the calculations. It has been found that although the building does absorb the heat into the structure, this offsets temperatures when the building becomes cooler at a later stage.

4.2. Mechanical vent

It is proposed that all the dwellings and PBSA units will be fitted with MVHR (mechanical ventilation with heat recovery) with tempered air units.

Figure 4.3 3D Layout

It is assumed that the tempered air is switched on when the temperature is greater than 22 degrees, with the tempered air achieving a 14 degree offset from the external air. The flow rates have been split as 30l/s in the living room or studio in the PBSA and 15l/s per bedroom.

4.3. Purge ventilation

Purge ventilation provision is required in each habitable room to comply with Part F of the Building Regulations. This should be capable of extracting a minimum of 4ach-1, per room directly to outside. The 4ach-1 is a minimum air change rate set out in the Building Regulations and is likely to be exceeded in reality through the opening of glazing.

4.4. Natural ventilation

The IES VE software also incorporates opening glazing into the calculations with the use of Macroflo. Although the Building Regulations give a fixed air change rate, the Macroflo software allows for all variables such as area of openable glazing, distance glazing can open and external conditions. This gives more accurate results regarding natural ventilation.

Part O requires that CIBSE TM59:2017 is used in conjunction the Building Regulation and has set the following conditions for occupancy and when glazing and internal doors can be assumed to be open:

When a room is occupied during the day (8am to 11pm), openings should be modelled to do all the following.

- Start to open when the internal temperature exceeds 22°C. i.
- Be fully open when the internal temperature exceeds 26°C. ii.
- iii. Start to close when the internal temperature falls below 26°C.
- Be fully closed when the internal temperature falls below 22°C. iv.

At night (11pm to 8am), openings should be modelled as fully open if both of the following apply.

- The opening is on the first floor or above and not easily accessible. i.
- The internal temperature exceeds 23°C at 11pm. ii.

When a ground floor or easily accessible room is unoccupied, both of the following apply.

- i. In the day, windows, patio doors and balcony doors should be modelled as open, if this can be done securely.
- ii. At night, windows, patio doors and balcony doors should be modelled as closed.

Internal doors within the dwellings are assessed to be fully open when the occupants are assumed to be awake (6am to 10pm). Window sills must be a minimum of 1.1m when used for overheating purposes.

The table below summarises the window opening assumed within the dynamic simulation:

	Opening		
	Openable Area %	Profile applied	
Internal doors	90	Open from 6am – 10pm Closed overnight	
Side hung bedroom door	20	ADO.Section_26a	
Side hung living room door	20	ADO.Section_26ab	
Side hung bedroom window	20	ADO.Section_26a	
Side hung living room window	20	ADO.Section_26ab	

4.5. Infiltration

Infiltration is the uncontrolled exchange of air between inside a building and outside through cracks, porosity, and other unintentional openings in the building, caused by the pressure difference effects of the wind and/or stack effect.

4.6. Occupancy profiles and internal equipment gains

CIBSE TM59:2017 sets out proposed people and internal equipment gains that should be used for dynamic simulations, when assessing the risk of overheating in homes. The proposed gains are shown in Tables 5.2 and 5.3 below:

	People Gains:				
Dwelling Type and Room:	No. of People:	Sensible Peak Load (kW):	Latent Peak Load (kW):		
Single bedroom	1	75	55		
Double bedroom	2	150	110		
1 bed – living and kitchens	1	75	55		
2 bed – living and kitchens	2	150	110		
3 bed – living and kitchens	3	225	165		

Table 5.2 People gains for each room type

	Room Type:					
Description:	Single Bedroom	Double Bedroom	Living & Kitchen	Living Room	Kitchen	Common Area
Equipment gains (kW)	80	80	450	150	300	N/A
Lighting profile (W/m ²)	2	2	2	2	2	2

Table 5.3 Equipment gains and lighting profile

The following graphs show the time periods and factors that are to be applied for the people and internal gains for each room type:

4.7. Shading and obstructions

Radiant heat from the sun passes through glass and is absorbed by building elements and furnishings which reradiate heat back into the space. Re-radiated heat has a longer wavelength and cannot pass back through the glass as easily, thus trapping the radiant heat causing heat gains in the dwelling.

A g-value of 0.40 has been assumed at 100 Chalk Farm, which reduces the solar gains through the glazing. Shading and obstructions have been added to the model.

4.8 Weather files

CIBSE released a new set of weather files for London in the middle of 2016. This included weather sets for three Design Summer Years (DSY) – 1976, 1989 and 2003. The current DSY1 is 1989 which represents a moderately warm summer. 1976 (DSY2) is a more extreme year with a long period of persistent warmth and 2003 (DSY3) is another extreme year which has a more intense single warm spell.

CIBSE Technical Memorandum 49, 2014 – Design Summer Years for London, provides guidance for which weather files are to be used. The current DSY (1989) is suitable for assessing buildings under the current climate.

Data from three weather stations have been examined and are available for use in simulation. London Heathrow Airport (LHR) is a representative of intermediate urban and suburban locations. London Gatwick Airport (GTW) and London Weather Centre (LWC) provide representative sites for rural and inner urban locations, respectively. As the proposed development is located in an urban location outside of London, the London Heathrow weather profile will be applied.

CIBSE TM59:2017 and TM52:2013 requires the DSY most appropriate to the location of the development to be used, for the 2020s with high emissions and 50% percentile scenario. The 2020s period is of particular interest as this relates to the period 2011-2040, which is the period we are now in. The 50% percentile changes are viewed as the 'best guess' level of change.

The results are shown in the appendix.

5. Strategy to Comply and Results

Initially passive measures are being proposed to reduce the risk of overheating within occupied spaces by reducing solar gains and improving ventilation.

As natural ventilation is not proposed due to opening limitations, applicants are required to submit two separate overheating analyses: one with openable windows and one with closed windows. This will ensure that passive measures have been maximised and the façade design has been optimised regardless of the constraints posed by the site's location.

In instances where security, air quality or noise concerns pose limitations to the opening of windows, applicants will be required to demonstrate that all passive design measures have been thoroughly investigated. This includes technical and cost feasibility assessments of the following fixed shading devices: external shutters, external blinds, awnings, and ventilated louvres. The feasibility assessment is explored in Appendix C.

Openable window simulations – Criterion 1 and 2

A simulation was completed whereby rooms were assumed to have openable glazing and standard MVHR. Below shows what has been assumed in the initial simulation.

therefore compliance with Part O.

Blinds have not been included in the dynamic modelling, as per the Part O and the London Plan guidance.

As per the GLA and Part O guidance, where there are acoustic and security constraints, bedroom/studio windows are restricted in opening overnight and MVHR with tempered air is required.

Strategy to comply with Part O – with acoustic constraints

No NTC is assumed to bedrooms on the ground floor due to security issues and all windows due to acoustic constraints

MVHR with tempered air has been assumed in all PBSA rooms and residentia dwellings, 30l/s to liviing rooms and studios, amd 15l/s to bedrooms

Common Areas

CIBSE TM59:2017 recommends that the risk of summer overheating is assessed in common areas where community heating pipework runs through them. There is no mandatory target to meet for common areas, but if an internal operative temperature of 28°C is exceeded for more than 3% of the total annual hours then this should be identified. 3% of the total annual hours is 262 hours.

The strategy applied to the common areas was for natural ventilation to all corridors, assuming 1ach. All but two common areas comply with the requirements.

Commercial Areas - TM52 Simulation

The commercial areas were investigated against the TM52 criteria to reduce the risk of overheating. The results show that all areas comply.

Cooling has been specified to the commercial areas. The London Plan requires the applicant to reduce the actual cooling demand below that of the notional for each of the non-residential spaces in the development where an active cooling load exists.

This is demonstrated in the relevant format within the energy statement '11494WCL-ZZ-ZZ-RP-Y-0001. The area weighted average actual and notional cooling demands for all non-residential areas are reported.

6. Conclusion

This overheating report shows that when including the passive and mechanical updates discussed in section 5.0 that all the rooms are compliant with the CIBSE TM59 Criteria and Part O.

The acoustic report advised that all units in the PBSA and residential block are affected by acoustic constraints, these dwellings, will require MVHR with tempered air. This will be activated when the temperature inside the dwelling exceeds 22°C, it is not full cooling but provides peak lopping of internal air temperature to assist with reducing the risk of overheating.

CIBSE TM59:2017 recommends that the risk of summer overheating is assessed in common areas where community heating pipework runs through them.

Appendix C – External shading feasibility study

The London Plan requires in the instance where proposed developments have security, air quality or noise concerns that pose limitations to the opening of windows, the applicant will be required to include technical and cost feasibility assessments of the following fixed shading devices: external shutters, external blinds, awnings and ventilated louvres.

The below table provides insight into the cost and feasibility of the various fixed shading devices.

Fixed Shading Devices	O&M	Aesthetic	Site	Cost	Comments
	impacts	impact	feasibility		
Ventilated Louvres	Med	High	Med	High	Not adopted – visual impact
					High cost
Acoustic Louvres	High	High	Low	High	Not adopted - due to lack of space to accommodate, walls are not thick enough for the
					louvre thickness required
External Shutters	Med	Med-	Med	High	Not adopted – visual impact, cost
	Med	High	IVIEU		Not adopted – visual impact, cost
		1 1611			
External Blinds	Med	Med-	High	Med	Not adopted – visual impact, cost
		High			
					Durability issue
Interstitial Blinds	Low	Low	Low	High	Not adopted – high cost
Awnings		High			Not adopted wisual impact, site too opclosed
Awrinings	LOW	ngn	LOW	LOW	Not adopted – visual impact, site too enclosed
					Durability issue
Deep reveals, fins and	Low	Med	High	Low	Adopted
balcony shading
