Part 3: GROUND MOVEMENT ASSESSMENT

Part 4: BASEMENT IMPACT ASSESSMENT

EXECUTIVE SUMMARY

This executive summary contains an overview of the key findings and conclusions. No reliance should be placed on any part of the executive summary until the whole of the report has been read. Other sections of the report may contain information that puts into context the findings that are summarised in the executive summary.

BRIEF

This report describes the findings of a site investigation carried out by Geotechnical and Environmental Associates Limited (GEA) on the instructions of Parmarbrook Ltd, on behalf of Nilkanth Estates, with respect to the redevelopment of the site by the construction of a new single-level basement beneath the rear chapel section of the building. The purpose of the investigation has been to research the history of the site with respect to possible contaminative uses, to determine the ground conditions and hydrogeology, to assess the extent of any contamination and to provide information to assist with the design of suitable foundations and retaining walls for the proposed development. The report also includes information required to comply with London Borough of Camden (LBC) Planning Guidance CPG Basements, relating to the requirement for a Basement Impact Assessment (BIA), including a ground movement analysis and building damage assessment.

DESK STUDY FINDINGS

The earliest map studied, dated 1878, shows the site to have already been developed with two terraced houses fronting onto Gloucester Street (now Old Gloucester Street) to the northeast, with rear gardens in the south west. Much of the existing road network and surrounding buildings are shown to have already been constructed by this time. By the time of the next map studied, dated 1896 the site is shown to have been redeveloped with the existing building which is labelled as a school. On the map dated 1916, a number of buildings located approximately 100 m to the northeast of the site are labelled as hospital buildings and on the map dated 1952 much of those buildings had been replaced with new buildings but were still in use as numerous Hospitals. Both the site and surrounding area have since remained essentially unchanged.

GROUND CONDITIONS

The investigation encountered the anticipated ground conditions in that beneath a moderate to significant thickness of made ground, the Lynch Hill Gravel was encountered and was underlain by the London Clay which extended to the full depth of the investigation, of 18.00 m. The made ground generally comprised brown silty clayey sand with gravel, brick, ash and concrete fragments and extends to a depth of 0.90 m below basement level and 3.00 m below ground floor level. The Lynch Hill Gravel generally comprised dense orange-brown slightly silty slightly clayey sandy fine to coarse sub-angular to sub-rounded gravel and extended to a depth of 6.50 m. The London Clay initially comprised stiff fissured brown silty clay, extending to a depth of 7.00 m, below which stiff fissured bluish grey slightly silty slightly sandy clay was encountered, and extended to the full depth of the investigation, of 18.00 m. Groundwater was encountered at a depth of 1.80 m in Borehole No 2, but was not encountered in Borehole No 3, which refused at a depth of 1.30 m, or Borehole No 1, where the necessary addition of water to aid drilling may have masked any such inflows.

The results of the testing have indicated one of the four samples tested to contain an elevated concentration of lead, while all other contaminant concentrations have been found to be below the respective guideline values.

RECOMMENDATIONS

The Llynch Hill Gravel should be suitable for the support of a moderately loaded raft foundation, although only a limited thickness of gravel will remain above the London Clay at formation level and a check of likely settlements should be carried out to ensure that the clay is not over-stressed. In addition, consideration will need to be given the presence of the deeper basement along the southern boundary. In order to ensure that additional load is not placed on the foundations of the adjacent structure to the south, the raft will not extend to the southern boundary.

GROUND MOVEMENT ASSESSMENT

The analysis has predicted that the proposed installation of the retaining wall underpins and excavation of the proposed basement are likely to result in the building damage for sensitive structures being Category 0 (negligible).The CPG Basements document indicates that where possible all building damage should be restricted to a maximum of Category 1, as set out in CIRIA Report 760, and as a result, the predictions are in line with Camden's requirements.

Part 1: INVESTIGATION REPORT

This section of the report details the objectives of the investigation, the work that has been carried out to meet these objectives and the results of the investigation. Interpretation of the findings is presented in Part 2.

1.0 INTRODUCTION

Geotechnical and Environmental Associates Limited (GEA) has been commissioned by Parmarbrook, on behalf of Nilkanth Estates, to carry out a ground investigation at No 25 Old Gloucester Street, London WC1N 3AF.

The report also includes information required to comply with London Borough of Camden (LBC) Planning Guidance CPG Basements, relating to the requirement for a Basement Impact Assessment (BIA), including a ground movement analysis and building damage assessment.

1.1 Proposed Development

It is understood that it is proposed to construct a new single-level basement beneath the rear part of the building, known as the chapel. It is also proposed to construct an additional three storeys to the main building behind the front five-storey section.

The existing building already has a partial single level basement spanning the majority of the site which has a finished floor level of 100.56 m TBM, approximately 3.25 m below existing ground floor level. The proposed basement beneath the remainder of the site will extend to a similar depth as the existing basement.

This report is specific to the proposed development and the advice herein should be reviewed if the proposals are amended.

1.2 Purpose of Work

The principal technical objectives of the work carried out were as follows:

- to check the history of the site with respect to previous contaminative uses;
- to determine the ground conditions and their engineering properties;
- to assess the possible impact of the proposed development on the local hydrogeology and surrounding structures;
- to provide advice with respect to the design of suitable foundations and retaining walls;
- to provide an indication of the degree of soil contamination present; and
- to assess the risk that any such contamination may pose to the proposed development, its users or the wider environment.

1.3 Scope of Work

In order to meet the above objectives, a desk study was carried out, followed by a ground investigation. The desk study comprised:

- a review of readily available geological and hydrogeological maps;
- a review of historical Ordnance Survey (OS) maps and environmental searches sourced from the Envirocheck database; and
- a walkover survey of the site carried out in conjunction with the fieldwork.

In light of the desk study, an intrusive ground investigation was carried out which comprised, in summary, the following activities:

- a single cable percussion borehole advanced to a depth of 18.00 m;
- two boreholes advanced to depths of 1.30 m and 2.70 m by window sampling methods;
- installation of a single groundwater monitoring standpipe to a depth of 6.50 m;
- a series of three trial pits advanced to a maximum depth of 1.60 m;
- modelling of the movements associated with the proposed basement construction and their impact on nearby structures;
- laboratory testing of selected soil samples for geotechnical purposes and for the presence of contamination; and
- provision of a report presenting and interpreting the above data, together with our advice and recommendations with respect to the proposed development.

The report includes a contaminated land assessment which has been undertaken in accordance with the methodology presented in Contaminated Land Report (CLR) 11[1] and involves identifying, making decisions on, and taking appropriate action to deal with, land contamination in a way that is consistent with government policies and legislation within the United Kingdom. The risk assessment is thus divided into three stages comprising Preliminary Risk Assessment, Generic Quantitative Risk Assessment, and Site-Specific Risk Assessment.

The exploratory methods adopted in this investigation have been selected on the basis of the constraints of the site including but not limited to access and space limitations, together with any budgetary or timing constraints. Where it has not been possible to reasonably use an EC7 compliant investigation technique a practical alternative has been adopted to obtain indicative soil parameters and any interpretation is based upon GEA's engineering experience, local precedent where applicable and relevant published information.

1.3.1 Basement Impact Assessment

The work carried out also includes a Hydrological and Hydrogeological Assessment and Land Stability Assessment (also referred to as Slope Stability Assessment), all of which form part of the BIA procedure specified in the London Borough of Camden (LBC) Planning Guidance CPG Basements[2] and their Guidance for Subterranean Development[3] prepared by Arup (the "Arup report"). The aim of the work is to provide information on surface water, land stability

1 *Model Procedures for the Management of Land Contamination* issued jointly by the Environment Agency and the Department for Environment, Food and Rural Affairs (DEFRA) Sept 2004
2 London Borough of Camden Planning Guidance CPG *Basements*
3 Ove Arup & Partners (2010) *Camden geological, hydrogeological and hydrological study. Guidance for Subterranean Development.* For London Borough of Camden November 2010

and groundwater and in particular to assess whether the development will affect neighbouring properties or groundwater movements and whether any identified impacts can be appropriately mitigated by the design of the development.

1.3.2 Qualifications

The land stability element of the Basement Impact Assessment (BIA) has been carried out by Martin Cooper, a BEng in Civil Engineering, a chartered engineer (CEng), member of the Institution of Civil Engineers (MICE), and Fellow of the Geological Society (FGS) who has over 20 years' specialist experience in ground engineering. The subterranean (groundwater) flow assessment has been carried out by John Evans, MSc in Hydrogeology, Chartered Geologist (CGeol) and Fellow of the Geological Society of London (FGS). The surface water and flooding assessment has been carried out by Rupert Evans, a hydrologist with more than ten years consultancy experience in flood risk assessment, surface water drainage schemes and hydrology / hydraulic modelling. Rupert Evans is a Chartered Environmentalist, Chartered Water and Environmental Manager and a Member of CIWEM.

The assessments have been made in conjunction with Steve Branch, a BSc in Engineering Geology and Geotechnics, MSc in Geotechnical Engineering, a chartered geologist (CGeol) and Fellow of the Geological Society (FGS) with some 30 years' experience in geotechnical engineering and engineering geology.

All assessors meet the qualification requirements of the Council guidance.

1.4 Limitations

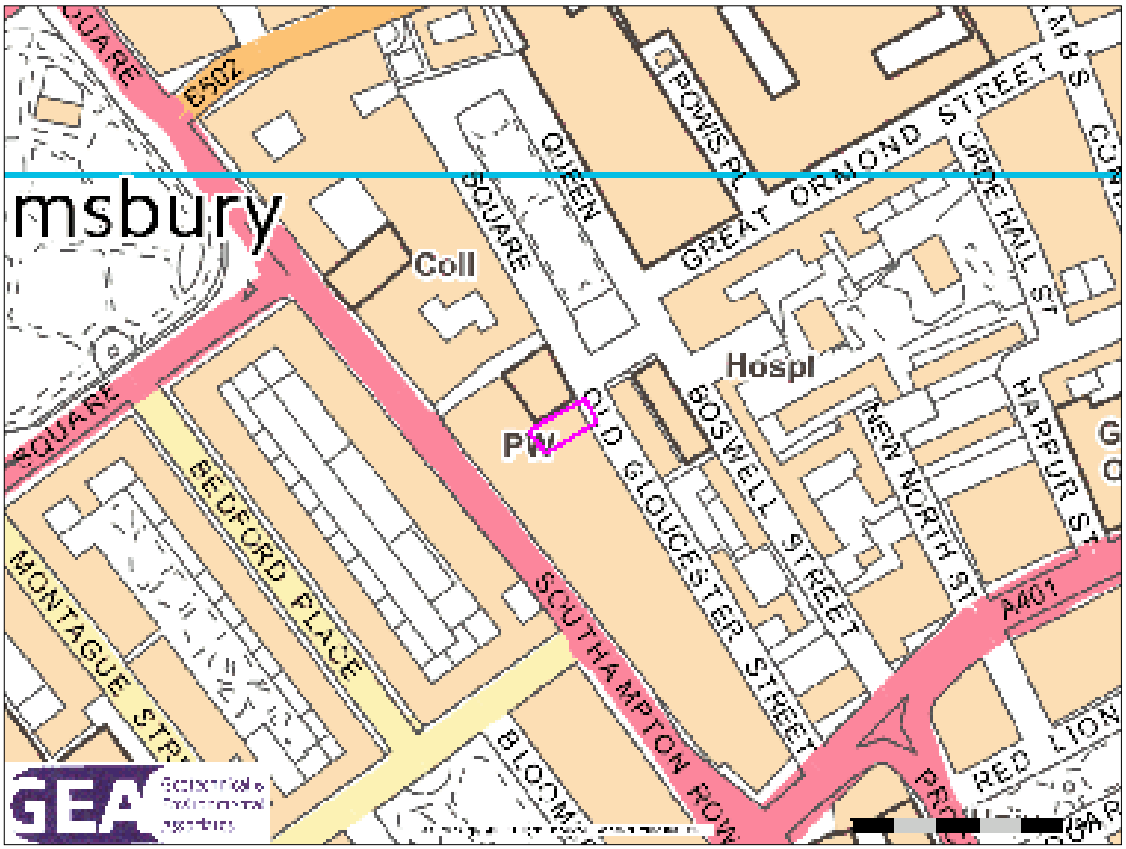
The conclusions and recommendations made in this report are limited to those that can be made on the basis of the investigation. The results of the work should be viewed in the context of the range of data sources consulted, the number of locations where the ground was sampled and the number of soil, gas or groundwater samples tested; no liability can be accepted for information in other data sources or conditions not revealed by the sampling or testing. Any comments made on the basis of information obtained from the client or other third parties are given in good faith on the assumption that the information is accurate; no independent validation of such information has been made by GEA.

2.0 THE SITE

2.1 Site Description

The site is located within the London Borough of Camden, approximately 325 m south of Russell Square London Underground Station and 720 m northeast of Tottenham Court Road London Underground Station. The site fronts onto Old Gloucester Street to the east and is bounded by No 26 Old Gloucester Street to the south, an adjoined five-storey building with a single level basement, by St. Georges Church, a three storey church, to the north, and by a five-storey building with a single level basement fronting onto Southampton Row to the west. The site may additionally be located by National Grid Reference 530387, 181874 and is shown on the map extract overleaf.

The site forms a regular shaped area measuring 22 m east-west by 10 m north-south and is occupied by a vacant building with a single level basement beneath the front of the site, extending back to the existing rear extension. The building is generally three-storeys in height, with a single storey, double height extension in the rear and a five storey section at the front. The building occupies the entire site and the site is essentially devoid of vegetation.



2.2 Site History

The history of the site and surrounding area has been researched by reference to historical Ordnance Survey (OS) maps sourced from the Envirocheck database.

The earliest map studied, dated 1878, shows the site to have already been developed with two terraced houses fronting onto Gloucester Street (now Old Gloucester Street) to the northeast, with rear gardens in the south west. Much of the existing road network and surrounding buildings are shown to have already been constructed by this time. By the time of the next map studied, dated 1896 the site is shown to have been redeveloped with the existing building which is labelled as a school. On the map dated 1916, a number of buildings located approximately 100 m to the northeast of the site are labelled as hospital buildings and on the map dated 1952 much of those buildings had been replaced with new buildings but were still in use as numerous Hospitals. Both the site and surrounding area have since remained essentially unchanged.

2.3 Other Information

A search of public registers and databases has been made via the Envirocheck database and relevant extracts from the search are appended. Full results of the search can be provided if required.

The search has revealed that there are no landfills, waste management, transfer, treatment or disposal sites within 750 m of the site. Additionally, there have been no pollution incidents to controlled waters within 200 m of the site.

The search has indicated that the site is located in an area where less than 1% of homes are affected by radon emissions; which is the lowest classification given by the Health Protection Agency (HPA) and therefore no radon protective measures will be necessary.

The site is not located within a nitrate vulnerable zone or any other sensitive land use.

2.4 Geology

The British Geological Survey (BGS) map of the area indicates the site to be underlain by the Lynch Hill Gravel over the London Clay Formation.

The Lynch Hill Gravel predominantly comprises sand and gravel, with localised lenses of clay and silt and is characteristically free-draining. The London Clay Formation is homogenous, slightly calcareous silty clay to very silty clay, with some beds of clayey silt grading to silty fine grained sand.

A historical BGS borehole drilled roughly 110 m south of the site encountered River Terrace Deposits to a depth of 3.0 m over the London Clay to a depth of 16.75 m. Below this depth, the Lambeth Group was encountered and extended to a depth of 32.30 m below which the Thanet Sand extends to a depth of 38.90 m. The Chalk was then encountered and extended to the maximum depth of the borehole, of 137.15 m. Reference to other nearby borehole archives confirms this geological succession to be accurate for the majority of the surrounding area

In addition, a previous ground investigation, carried out by GEA approximately 400 m to the northeast of the site, encountered gravel, extending to a depth of 4.40 m below which the London Clay was encountered and was found to extend to a depth of 16.20 m. Below this depth, the Lambeth Group was encountered and extended to the full depth of the investigation, of 20.45 m.

2.5 Hydrology and Hydrogeology

The Lynch Hill Gravel is classified as a Secondary 'A' Aquifer, which refers to strata that contain permeable layers capable of supporting water supply at a local level and in some cases may form an important source of base flow for local rivers, as defined by the Environment Agency (EA). The underlying London Clay is classified as a Non-Aquifer and Unproductive Stratum, which refers to a soil or rock with low permeability that has a negligible effect on local water supply or river base flow.

There are no EA designated Source Protection Zones (SPZs) on the site. The Envirocheck report indicates that the site is not located within 1 km of any surface water features. The site is not located in an area at risk of flooding from rivers or sea or surface water, as defined by the EA, although a section of Old Gloucester Street is shown to be at low risk of surface water flooding.

Reference to the Lost Rivers of London[4] indicates that a tributary of the River Fleet flowed along Euston Road in a easterly direction, approximately 200 m to the north of the site. The direction of groundwater flow beneath the site is likely to be in a south-easterly direction, downslope towards the River Thames.

Any surface water runoff that infiltrates the shallow made ground and Lynch Hill Gravel above the London Clay is likely to flow southwards along the surface of the London Clay towards the River Thames which is located roughly 1.2 km to the south.

[4] Nicholas Barton & Stephen Myers (2016) *The Lost Rivers of London.* Historical Publications Ltd

The permeability of the Lynch Hill Gravel is expected to range between about 1 x 10^{-6} m/s and 1 x 10^{-4} m/s, whereas in contrast, any groundwater flow within the London Clay will be at a very slow rate, due to its negligible permeability. Published data for the permeability of the London Clay indicates the horizontal permeability to generally range between 1 x 10^{-10} m/s and 1 x 10^{-8} m/s, with an even lower vertical permeability. The London Clay cannot therefore support groundwater flow and as such does not support a "water table" or continuous piezometric surface. Boreholes constructed within clays do fill with water due to the often high water content of shallow clays; however, this is not reflective of groundwater flow in a porous and permeable saturated stratum.

During the aforementioned nearby previous GEA investigation groundwater was measured at a depth of 2.21 m, within the single standpipe installed, during a single groundwater monitoring visit. However, groundwater is shown to generally be present at a depth of about 4.00 m closer to the site.

2.6 Preliminary Risk Assessment

Part IIA of the Environmental Protection Act 1990, which was inserted into that Act by Section 57 of the Environment Act 1995, provides the main regulatory regime for the identification and remediation of contaminated land. The determination of contaminated sites is based on a "suitable for use" approach which involves managing the risks posed by contaminated land by making risk-based decisions. This risk assessment is carried out on the basis of a source-pathway-receptor approach.

2.6.1 Source

The desk study research has indicated that the site was developed with housing prior to the construction of the existing building and is therefore not considered to have had a contaminative history.

2.6.2 Receptor

The future end users of the commercial building will represent moderate sensitivity receptors. The site is underlain by a Secondary 'A' Aquifer and therefore groundwater is considered to be a relatively sensitive receptor. Similarly, perched water may also exist in the made ground or in the vicinity of existing foundations. Buried services are likely to come into contact with any contaminants present within the soils through which they pass and site workers are likely to come into contact with any contaminants present during demolition and construction works.

2.6.3 Pathway

The new building will cover the entire footprint of the site and it is likely that this will effectively form a barrier between any contaminants within the near-surface soils and end-users or infiltration of surface water. Furthermore it is understood that areas of soft landscaping will not form part of the proposed development.

Buried services will be exposed to any contaminants present within the soil through direct contact and site workers will come into contact with the soils during construction works. There is thus considered to be very low potential for a contaminant pathway to be present between any potential contaminant source and a target for the particular contaminant.

2.6.4 Preliminary Risk Appraisal

On the basis of the above it is considered that there is a low risk of there being a significant contaminant linkage at this site, which would result in a requirement for major remediation work. Furthermore as there is no evidence of filled ground within the vicinity, there is not considered to be a significant potential for hazardous soil gas to be present on or migrating towards the site; there should thus be no need to consider soil gas exclusion systems.

3.0 SCREENING

The London Borough of Camden guidance suggests that any development proposal that includes a subterranean basement should be screened to determine whether or not a full Basement Impact Assessment (BIA) is required.

3.1 Screening Assessment

A number of screening tools are included in the Arup document and for the purposes of this report reference has been made to Appendix E which includes a series of questions within a screening flowchart for three categories; groundwater flow, land stability and surface water flow. Responses to the questions are tabulated on the following pages.

3.1.1 Subterranean (groundwater) Screening Assessment

Question	Response for 25 Old Gloucester Street
1a. Is the site located directly above an aquifer?	*Yes, a Secondary 'A' Aquifer.*
1b. Will the proposed basement extend beneath the water table surface?	No. On the basis of the findings of previous nearby investigations the groundwater level in the area of the site is within the bottom two meters of the gravel at a depth of about 4 m, which is 1 m below the depth of the proposed basement. In addition, the site is already partially underlain by a basement that currently extends to the same depth as the proposed basement extension.
2. Is the site within 100 m of a watercourse, well (used/ disused) or potential spring line?	No. The closest water course to the site is a tributary to the River Fleet which is located approximately 200 m to the north of the site.
4. Will the proposed basement development result in a change in the proportion of hard surfaced / paved areas?	No. The entire site is and will remain hardcovered.
5. As part of the site drainage, will more surface water (e.g. rainfall and run-off) than at present be discharged to the ground (e.g. via soakaways and/or SUDS)?	No. The site is entirely occupied by the existing building and will remain so after the completion of the development. Therefore the drainage situation will remain unchanged.
6. Is the lowest point of the proposed excavation (allowing for any drainage and foundation space under the basement floor) close to or lower than, the mean water level in any local pond or spring line?	No.

The above assessment has identified the following potential issues that need to be assessed.

Q1a The site is located directly above the Lynch Hill Gravel, which is a Secondary 'A' Aquifer.

3.1.2 Stability Screening Assessment

Question	Response for 25 Old Gloucester Street
1. Does the existing site include slopes, natural or manmade, greater than 7°?	No. The site is entirely occupied by the existing building and does not contain any slopes at all.
2. Will the proposed re-profiling of landscaping at the site change slopes at the property boundary to more than 7°?	No. The site profile is unlikely to change significantly.
3. Does the development neighbour land, including railway cuttings and the like, with a slope greater than 7°?	No, reference to Fig 16 of the Arup report indicates no slopes of greater than 7° on neighbouring land
4. Is the site within a wider hillside setting in which the general slope is greater than 7°?	No. Fig 16 of the Arup indicates the area around the site to be essentially level.
5. Is the London Clay the shallowest stratum at the site?	No.
6. Will any trees be felled as part of the proposed development and / or are any works proposed within any tree protection zones where trees are to be retained?	No.
7. Is there a history of seasonal shrink-swell subsidence in the local area and / or evidence of such effects at the site?	No.
8. Is the site within 100 m of a watercourse or potential spring line?	No. The site is not located within 1 km of any watercourses.
9. Is the site within an area of previously worked ground?	No. Historical maps indicate that the site has been in its existing condition since the early 20th Century and there is no evidence of extraction having taken place.
10a. Is the site within an aquifer?	*Yes, a Secondary 'A' Aquifer.*
10b. Will the proposed basement extend beneath the water table such that dewatering may be required during construction?	Unlikely. The proposed basement excavation is unlikely to require dewatering as the excavation will not extend beneath the water table.
12. Is the site within 5 m of a highway or pedestrian right of way?	No. The proposed basement is located at the rear of the building which is located more than 15 m from the nearest highway or pedestrian right of way.
13. Will the proposed basement significantly increase the differential depth of foundations relative to neighbouring properties?	*Possibly. The founding depths of some of the surrounding properties are unknown and as such the proposed founding depth could be significantly deeper.*
14. Is the site over (or within the exclusion zone of) any tunnels, eg railway lines?	No. A search of publicly available maps has not indicated tunnels under the site.

The above assessment has identified the following potential issues that need to be assessed.

Q10a The site is located within the Secondary 'A' Aquifer of the Lynch Hill Gravel.
Q13 The development will potentially increase the foundation depths relative to the neighbouring properties.

3.1.3 Surface Flow and Flooding Screening Assessment

Question	Response for 25 Old Gloucester Street
1. Is the site within the catchment of the pond chains on Hampstead Heath?	No. The Arup report confirms that the site is not located within this catchment area.
2. As part of the proposed site drainage, will surface water flows (e.g. volume of rainfall and peak run-off) be materially changed from the existing route?	No. There will not be an increase in impermeable area across the ground surface above the basement, so the surface water flow regime will be unchanged. The basement will be beneath the footprint of the existing building, therefore the 1m distance between the roof of the basement and ground surface as recommended by the Arup report and para 2.16 of the CPG Basements documentdoes not apply across these areas.
3. Will the proposed basement development result in a change in the proportion of hard surfaced / paved areas?	No. There will not be an increase in impermeable area across the ground surface above the basement.
4. Will the proposed basement development result in changes to the profile of the inflows (instantaneous and long term) of surface water being received by adjacent properties or downstream watercourses?	No. There will not be an increase in impermeable area across the ground surface above the basement, so the surface water flow regime will be unchanged. The basement will be beneath the footprint of the existing building, therefore the 1m distance between the roof of the basement and ground surface as recommended by the Arup report and para 2.16 of the CPG Basements document does not apply across these areas.
5. Will the proposed basement result in changes to the quality of surface water being received by adjacent properties or downstream watercourses?	No. The proposed basement is very unlikely to result in any changes to the quality of surface water being received by adjacent properties or downstream watercourses as the surface water drainage regime will be unchanged and the land uses will remain the same.
6. Is the site in an area identified to have surface water flood risk according to either the Local Flood Risk Management Strategy or the Strategic Flood Risk Assessment or is it at risk of flooding, for example because the proposed basement is below the static water level of nearby surface water feature?	No. The findings of this BIA together with the Camden Flood Risk Management Strategy dated 2013 and Figures 3i, 4e, 5a and 5b of the SFRA dated 2014, in addition to the Environment Agency online flood maps show that the site has a low flooding risk from surface water, sewers, reservoirs (and other artificial sources), groundwater and fluvial/tidal watercourses. It is possible that the basement will be constructed within a perched water table and the recommendations outlined in the BIA with regards to water-proofing and tanking of the basement will reduce the risk to acceptable levels. In accordance with paragraph 5.11 of the CPG a positive pumped device will be installed in the basement in order to further protect the site from sewer flooding. The site is located within the Critical Drainage Area Group03_003 but not within a Local Flood Risk Zone, as identified in the Camden SWMP and Updated SFRA Figure 6/Rev 2.

The above assessment has not identified any potential issues that need further assessment, although the hydrological setting is discussed further within this report.

4.0 SCOPING AND SITE INVESTIGATION

The purpose of scoping is to assess in more detail the factors to be investigated in the impact assessment. Potential impacts are assessed for each of the identified potential impact factors.

The potential impacts of the proposed development on surface flow and flooding and subterranean flow will need to be dealt with in separate assessments, such that the following section focuses on the potential impacts that may have an impact on slope stability.

4.1 Potential Impacts

The following potential impacts have been identified.

Potential Impact	Consequence
The site is located directly above an aquifer	The site is underlain by the Lynch Hill Gravel, which is classified as a Secondary 'A' Aquifer. This has the potential of being able to support local water supplies as well as forming an important source of base flow for local rivers. There is the potential for the hydrogeological setting to be affected by a basement development.
The development will increase the founding depths relative to neighbours.	If not designed and constructed appropriately, the excavation of a basement may result in structural damage to neighbouring buildings and structures.

These potential impacts have been investigated through the site investigation, as detailed in Section 9.0.

4.2 Exploratory Work

In order to meet the objectives described in Section 1.2, as far as possible within the access restrictions, a single borehole was advanced to a depth of 18.00 m using a dismantlable cable percussion rig which was supplemented by two hand held window sampler boreholes, which were drilled from basement level, and a series of three hand excavated trial pits, advanced to a maximum depth of 1.60 m below ground level and 1.28 m below existing basement level. It was initially proposed to advance the window sampler boreholes to a depth of 5.00 m but the boreholes could only be advanced to depths of 1.30 m and 2.70 m below basement level due to the density of the gravel encountered.

During boring, disturbed samples were obtained from the boreholes for subsequent laboratory examination and testing. Standard Penetration Tests (SPTs) were carried out at regular intervals in the cable percussion borehole to provide quantitative data on the strength of soils encountered. It was also proposed to retrieve undisturbed samples from the cable percussion borehole, which was not possible in practice as the suspended floor supporting the rig was not considered strong enough to allow the sampling to take place.

All of the above work was carried out under the part time supervision of a geotechnical engineer from GEA.

The borehole records, trial pit records and results of the laboratory testing are enclosed, together with a site plan indicating the exploratory positions.

4.3 Sampling Strategy

The scope of the works was specified by the consulting engineers, with input from GEA. The borehole positions were positioned on site by GEA with due regard to the proposed development, whilst avoiding areas of known services.

Four samples of the made ground was subjected to analysis for a range of common industrial contaminants and contamination indicative parameters. For this investigation the analytical suite for the soil included a range of metals, speciation of total petroleum hydrocarbons (TPH), polycyclic aromatic hydrocarbons (PAH), total cyanide and monohydric phenols for the purposes of general coverage. The soil sample was selected to provide a general view of the chemical conditions of the soils that are likely to be involved in a human exposure or groundwater pathway and to provide advice in respect of re-use or for waste disposal classification.

The contamination analyses were carried out at an MCERTs accredited laboratory with the majority of the testing suite accredited to MCERTS standards. Details of the MCERTs accreditation and test methods are included in the Appendix together with the analytical results.

5.0 GROUND CONDITIONS

The investigation encountered the anticipated ground conditions in that beneath a moderate to significant thickness of made ground, the Lynch Hill Gravel was encountered and was underlain by the London Clay which extended to the full depth of the investigation, of 18.00 m.

5.1 Made Ground

The made ground generally comprised brown silty clayey sand with gravel, brick, ash and concrete fragments and extends to a depth of 0.90 m below basement level and 3.00 m below ground floor level.

Apart from the presence of fragments of extraneous material noted above, no visual or olfactory evidence of contamination was observed during the fieldwork. Four samples of the made ground were tested for the presence of contamination and the results are detailed within Section 5.5.

5.2 Lynch Hill Gravel

The Lynch Hill Gravel generally comprised dense orange-brown slightly silty slightly clayey sandy fine to coarse sub-angular to sub-rounded gravel and extended to a depth of 6.50 m below ground floor level.

5.3 London Clay

The London Clay initially comprised stiff fissured brown silty clay, extending to a depth of 7.00 m below ground level, below which stiff fissured bluish grey slightly silty slightly sandy clay was encountered, and proved to the full depth of the investigation, of 18.00 m.

5.4 Groundwater

Groundwater was encountered at a depth of 1.80 m in Borehole No 2, but was not encountered in Borehole No 3, which refused at a depth of 1.30 m, or Borehole No 1, where the necessary addition of water to aid drilling may have masked any such inflows. A groundwater monitoring standpipe was installed in each of the boreholes which have been monitored on a single occasion to date. The findings of the monitoring visit are detailed in the table overleaf.

Date	Borehole No	Depth to water (m)
27/04/2017 (during fieldwork)	1	4.50
	2	DRY
	3	DRY

5.5 Soil Contamination

The table below sets out the values measured within the four samples of the made ground analysed; all concentrations are in mg/kg unless otherwise stated.

Determinant	TP3 0.40 m	TP1 0.30 m	TP2 0.60 m	BH3 0.10 m
pH	9.1	8.0	8.1	10.4
Arsenic	21	22	12	20
Cadmium	<0.2	<0.2	<0.2	<0.2
Chromium	19	15	15	16
Copper	63	61	38	33
Mercury	2.0	<0.3	<0.3	<0.3
Nickel	20	17	14	13
Lead	260	**400**	250	180
Selenium	<1.0	<1.0	<1.0	<1.0
Zinc	65	62	44	76
Total Cyanide	<1	<1	<1	<1
Total Phenols	<1.0	<1.0	<1.0	<1.0
Sulphide	4.1	1.2	1.1	2.3
Total PAH	<1.60	<1.60	8.38	3.10
Benzo(a)pyrene	<0.10	<0.10	0.67	0.21
Naphthalene	<0.05	<0.05	<0.05	<0.05
TPH	<10	<10	35	10
Total organic carbon %	1.2	0.9	0.5	0.3

Notes: Figure in **bold** indicates concentration in excess of risk-based soil guideline values, as discussed in Part 2 of this report.

The results of the testing have indicated one of the four samples tested to contain an elevated concentration of lead, while all other contaminant concentrations have been found to be below the respective guideline values.

5.5.1 Generic Quantitative Risk Assessment

The use of a risk-based approach has been adopted to provide an initial screening of the test results to assess the need for subsequent site-specific risk assessments. To this end, the table below indicates those contaminants of concern that have values in excess of a generic human health risk based guideline values which is either the CLEA[5] Soil Guideline Value where available, or is a Generic Screening Value calculated using the CLEA UK Version 1.06[6] software assuming a residential end use without plant uptake, or is based on the DEFRA Category 4 Screening values[7]. The key generic assumptions for this end use are as follows:

- that groundwater will not be a critical risk receptor;
- that the critical receptor for human health will be young female children aged zero to six years old;
- that the exposure duration will be six years;
- that the critical exposure pathways will be direct soil and indoor dust ingestion, skin contact with soils and indoor dust, and inhalation of indoor and outdoor dust and vapours; and
- that the building type equates to a two-storey small terraced house.

It is considered that these assumptions are acceptable for this generic assessment of this site, albeit somewhat conservative as a portion of the site will be used for commercial usage. The tables of generic screening values derived by GEA and an explanation of how each value has been derived are included in the Appendix.

Where contaminant concentrations are measured at concentrations below the generic screening value it is considered that they pose an acceptable level of risk and thus further consideration of these contaminant concentrations is not required. However where concentrations are measured in excess of these generic screening values there is considered to be a potential that they could pose an unacceptable risk and thus further action will be required which could include;

- additional testing to zone the extent of the contaminated material and thus reduce the uncertainty with regard to its potential risk;
- site specific risk assessment to refine the assessment criteria and allow an assessment to be made as to whether the concentration present would pose an unacceptable risk at this site; or
- soil remediation or risk management to mitigate the risk posed by the contaminant to a degree that it poses an acceptable risk.

5 *Updated Technical Background to the CLEA Model (Science Report SC050021/SR3) Jan 2009* and Soil Guideline Value reports for specific contaminants; all DEFRA and Environment Agency.
6 Contaminated Land Exposure Assessment (CL|EA) Software Version 1.06 Environment Agency 2009
7 CL:AIRE (2013) *Development of Category 4 Screening Levels for Assessment of Land Affected by Contamination* Final Project Report SP1010 and DEFRA (2014) *Development of Category 4 Screening Levels for Assessment of Land Affected by Contamination* Policy Companion Document SP1010

The results of the testing have indicated one of the four samples tested to contain elevated concentrations of lead.

The significance of these results is considered further in Part 2 of the report.

5.6 Existing Foundations

A summary of the findings of the trial pits is tabulated below and the trial pit records are included in the Appendix.

Trial Pit No	Section	Structure	Foundation detail	Bearing Stratum
1	B-B'	Northern boundary (at rear)	Brick wall extending to the full depth of the trial pit of 1.60 m.	Unconfirmed
1	A-A'	Western boundary (at rear)	Brick wall extending to the full depth of the trial pit of 1.60 m.	Unconfirmed
2	A-A'	Southern Boundary (at rear)	Brick Corbels over concrete strip footing bearing at a depth of 1.28 m	Made Ground (brown silty clayey sand with gravel, brick, ash and concrete fragments)
3	A-A'	Internal columns	Brick corbels over concrete pad foundation extending to a depth of 0.87 m	Made Ground (brown silty clayey sand with gravel, brick, ash and concrete fragments)

Part 2: DESIGN BASIS REPORT

This section of the report provides an interpretation of the findings detailed in Part 1, in the form of a ground model, and then provides advice and recommendations with respect to the proposed development.

6.0 INTRODUCTION

It is understood that it is proposed to construct a new single-level basement beneath the rear section of the existing, known as the chapel. It is also proposed to construct an additional three storeys to the main building behind the front five-storey section of the building. It is proposed to construct the retaining walls for the development through concrete underpinning and the loads of the development are anticipated to be about 50 kN/m^2 along the walls, with a raft slab which will have a pressure of 35 kN/m^2. The loads of the three-storey upwards extension are not known at this stage.

7.0 GROUND MODEL

The desk study has revealed that the site has not had a potentially contaminative history on the basis that it has been occupied by housing and the existing building for its entire developed history. On the basis of the fieldwork, the ground conditions at this site can be characterised as follows:

- below a moderate to significant thickness of made ground, the Lynch Hill Gravel was encountered over London Clay, which was found to extend to the maximum depth of the investigation, of 18.00 m below ground level;
- the made ground generally comprises brown silty clayey sand with gravel, brick, ash and concrete fragments and extends to a depth of 0.90 m below basement level and 3.00 m below ground floor level where the existing basement is not present;
- the Lynch Hill Gravel comprises dense orange-brown slightly silty slightly clayey sandy fine to coarse sub-angular to sub-rounded gravel and extends to a depth of 6.50 m;
- the London Clay initially comprises a 0.50 m thick horizon of stiff fissured brown silty clay, below which stiff fissured bluish grey slightly silty slightly sandy clay is present and extends to the full depth of the investigation, of 18.00 m;
- groundwater is considered to be present within the Lynch Hill Gravel at a depth of about 4.50 m; and
- contamination testing indicated a single sample of the made ground to contain an elevated concentration of lead.

8.0 ADVICE AND RECOMMENDATIONS

The ground investigation has indicated that formation level for the proposed 3.00 m deep basement will be within the Lynch Hill Gravel. Significant groundwater inflows are not anticipated in the basement excavation and in view of the anticipated light loads it should be possible to adopt spread foundations or a raft foundation constructed from basement level to support the building.

8.1 Basement Construction

8.1.1 Basement Excavations

The formation level for the basement is likely to be within the sandy gravel of the Lynch Hill Gravel at a depth of approximately 3.00 m below ground level. On the basis of the groundwater observations to date, groundwater is not expected to be encountered in the basement excavation, having been measured at a depth of 4.50 m below ground level, which equates to about 1.00 m below the level of the proposed basement. It would be prudent to continue to monitor the standpipes for as long as possible in order to determine equilibrium level and the extent of any seasonal variations.

There are a number of methods by which the sides of the basement excavation could be supported in the temporary and permanent conditions. The choice of wall may be governed to a large extent by whether it is to be incorporated into the permanent works and have a load bearing function. The final choice will depend to a large extent on the need to protect nearby structures from movements, the required overall stiffness of the support system, and the need to control groundwater movement through the wall in the temporary condition. In this respect the stability of the existing building will be paramount.

It is likely that most appropriate method of supporting the basement will be through conventional concrete underpinning. Significant inflows of groundwater are not expected to be encountered in the basement excavation, but it would be prudent for the chosen contractor to have a contingency plan in place to deal with any perched groundwater inflows from within the made ground, particularly in the vicinity of the existing foundations, as a precautionary measure.

The use of underpinning will require the soils being underpinned to stand unsupported and difficulties may be encountered with unsupported excavations in the made ground and the underlying sandy horizons of the Lynch Hill Gravel, particularly where groundwater is encountered. If instability is encountered while excavating for the underpins the use of sacrificial back sheets should allow the soil to stand while the underpins are cast.

The ground movements associated with the basement excavation will depend on the method of excavation and support and the overall stiffness of the basement structure in the temporary condition. Thus, a suitable amount of propping will be required to provide the necessary rigidity and the timing of the provision of support to the wall will have an important effect on movements. The stability of the existing foundations will need to be ensured at all times and the retaining walls will need to be designed to support the loads from these foundations unless they are underpinned. Careful workmanship will be required in the construction of the underpins and it is recommended that a suitable specialist contractor is consulted in this respect. A Ground Movement Analysis has been carried out in accordance with the requirements of CPG Basements and is presented in Part 3 of this report.

8.1.2 Basement Retaining Walls

The following parameters are suggested for the design of the permanent basement retaining walls.

Stratum	Bulk Density (kg/m^3)	Effective Cohesion (c' – kN/m^2)	Effective Friction Angle (Φ' – degrees)
Made Ground	1700	Zero	20
Lynch Hill Gravel	1900	Zero	32
London Clay	1950	Zero	23

Groundwater is unlikely to be encountered within the excavation, although monitoring of the standpipes should be continued in order to establish equilibrium levels and seasonal high levels. At this stage, it is recommended that for the design of the retaining walls, groundwater level can be assumed to be below the depth of the basement, as indicated by the investigation carried out to date. However, it is recommended that this is reviewed following further monitoring and investigation into the presence of perched groundwater within the made ground, as consideration should be given to the risk of groundwater and surface water collecting behind the retaining walls within granular horizons. The use of a fully effective drainage system would be prudent in this respect. The advice in BS8102:2009[8] should be followed in the design of the basement retaining walls and with regard to waterproofing requirements.

8.2 Spread Foundations

The excavation of the proposed basement is likely to result in formation level within the Lynch Hill Gravel and it should be possible to adopt moderate width pad or strip foundations in the sandy gravel, designed to apply a net allowable bearing pressure of 300 kN/m^2 below basement level. The recommended bearing pressure provides an adequate factor of safety against bearing capacity failure and should ensure that settlement remains within normal tolerable limits.

8.3 Re-use of Existing Foundations

The existing and proposed loads for the upwards extension are not currently known. The existing building was constructed during the late 19th century and, as such, settlements associated with the existing loads should now be complete. It should therefore be possible to apply the same magnitude of load onto the foundations and expect the same magnitude of settlement, provided that the gross pressure applied by the foundations does not exceed the ultimate bearing capacity of the bearing stratum and that the footings are bearing on natural soil.

The trial pits have indicated the foundations of the internal columns to be bearing within the Lynch Hill Gravel but further trial pitting will be required in due course to determine the configuration of the foundations of the boundary walls. If foundations are found to be bearing on made ground, they will need to be locally underpinned to extend to the natural soil.
In order to confirm the size of the pads required and once all levels and loads are finalised, it is recommended that a full settlement analysis be carried out in order to estimate the likely expected settlements.

8.4 Basement Raft Foundation

8 BS8102 (2009) *Code of practice for protection of below ground structures against water from the ground*

A basement raft foundation may be an appropriate foundation solution, as it would take advantage of the unloading at formation level as a result of the excavation; the suitability of a raft foundation will depend on the resultant net pressure to be applied by the new structure, taking into consideration the overburden and potential heave associated with the basement excavation. The raft would need to be designed to be rigid to resist any variation in upwards and downwards forces, in order to prevent differential movements. In this respect, if a raft is considered and once the loads have been finalised, it would be prudent to carry out additional analysis in order to determine the likely heave / settlements associated with the use of a raft foundation.

8.5 Piled Foundations

For the ground conditions at this site, some form of bored pile is likely to be the most appropriate. A conventional rotary augered pile may be appropriate but consideration will need to be given to the possible instability and water ingress in the made ground and Lynch Hill Gravel. The use of bored piles installed using continuous flight auger (cfa) techniques may therefore be the most appropriate, especially as the use of a limited access rig may be required.

The following table of ultimate coefficients may be used for the preliminary design of bored piles from ground floor level, based on the measured SPT and cohesion / depth graph in the appendix.

Stratum	Depths m	kN / m²
Ultimate Skin Friction		
Made Ground & Basement Excavation	GL to 3.00	Ignore (Basement excavation)
Lynch Hill Gravel (Gravel)	3.00 to 6.50	49.5
London Clay (α = 0.5)	6.50 to 18.00	Increasing linearly from 45 to 105
Ultimate End Bearing		
London Clay	10.00 to 18.00	Increasing linearly from 1170 to 1890

In the absence of pile tests, guidance from the London District Surveyors Association (LDSA)[9] suggests that a factor of safety of 2.6 should be applied to the above coefficients in the computation of safe theoretical working loads. On the basis of the above coefficients, the following preliminary pile capacities have been estimated.

Pile diameter mm	Depth Below Ground Level m	Safe Working Load kN
450	10	285
	12	365

[9] LDSA (2009) *Foundations No 1 – Guidance notes for the design of straight shafted bored piles in London Clay*. LDSA Publications

The above examples are not intended to constitute any form of recommendation with regard to pile size or type, but merely serve to illustrate the use of the above coefficients. Specialist piling contractors should be consulted with regard to the design of an appropriate piling scheme and their attention should be drawn to potential groundwater within the made ground Lynch Hill Gravel.

8.6 Basement Floor Slab

Following the excavation of the basement, it should be possible to adopt a lightly loaded ground bearing floor slab within the Lynch Hill Gravel which will need to be designed to cope with potential uplift forces due to the presence of groundwater and the heave of the underlying London Clay.

8.7 Shallow Excavations

On the basis of the borehole and trial pit findings, it is considered that shallow excavations for foundations and services that extend through the made ground or Lynch Hill Gravel should remain generally stable in the short term, although some instability may occur. However, should deeper excavations be considered or if excavations are to remain open for prolonged periods it is recommended that provision be made for battered side slopes or lateral support. Where personnel are required to enter excavations, a risk assessment should be carried out and temporary lateral support or battering of the excavation sides considered in order to comply with normal safety requirements.

Groundwater inflows may be encountered within the made ground, particularly within the vicinity of existing foundations. Some form of groundwater may therefore be required and should be suitably controlled by sump pumping, although this should be confirmed by additional investigations, ideally in the form of trial excavations to the full depth of the proposed basement.

8.8 Effect of Sulphates

Chemical analyses carried out on two samples of the Lynch Hill Gravel and a single sample of the London Clay have revealed concentrations of soluble sulphate and near-neutral pH in accordance with Class DS-1. The measured pH value of the samples show that an ACEC class of AC-1 of Table C2 would be suitable. This assumes a mobile water condition at the site. The guidelines contained in the above digest should be followed in the design of foundation concrete.

8.9 Site Specific Risk Assessment

The desk study research has indicated that the site has not had a potentially contaminative history, having been occupied by housing and the existing building for its entire known developed history. In addition, no sources of potential contamination have been identified across the site or the immediate surrounding area. The contamination testing has however indicated one of the four samples of made ground tested to contain an elevated concentration of lead.

The exact source of the contamination is unknown, however the made ground was noted as containing variable inclusions of extraneous material such as ash, which if present in the samples tested may have accounted for the elevated concentrations. In any case, the contamination is not considered likely to be in a soluble form and therefore does not pose a risk to groundwater and thus neighbouring sites.

The majority of the soil is likely to be excavated and removed from site in any case as part of reducing the level of the site to that of the proposed basement and no areas of soft landscaping are proposed. As a result, a risk to site users is not envisaged. The contamination poses a risk to site workers during the groundworks, as discussed in turn below.

8.9.2 Site Workers

Site workers should be made aware of the potential contamination and a programme of working should be identified to protect workers handling any soil. The method of site working should be in accordance with guidelines set out by HSE[10] and CIRIA[11] and the requirements of the Local Authority Environmental Health Officer.

A watching brief should also be maintained during the groundwork, and if suspicious soils are encountered then a suitably qualified engineer should inspect the soils and further testing carried out if required.

8.10 Waste Disposal

Under the European Waste Directive, waste is classified as being either Hazardous or Non-Hazardous and landfills receiving waste are classified as accepting hazardous or non-hazardous wastes or the non-hazardous sub-category of inert waste in accordance with the Waste Directive. Waste classification is a staged process and this investigation represents the preliminary sampling exercise of that process. Once the extent and location of the waste that is to be removed has been defined, further sampling and testing may be necessary. The results from this ground investigation should be used to help define the sampling plan for such further testing, which could include WAC leaching tests where the totals analysis indicates the soil to be a hazardous waste or inert waste from a contaminated site. It should however be noted that the Environment Agency guidance WM3[12] states that landfill WAC analysis, specifically leaching test results, must not be used for waste classification purposes.

Any spoil arising from excavations or landscaping works, which is not to be re-used in accordance with the CL:AIRE[13] guidance, will need to be disposed of to a licensed tip. Waste going to landfill is subject to landfill tax at either the standard rate of £ £84.40 per tonne (about £150 per m^3) or at the lower rate of £2.65 per tonne (roughly £5 per m^3). However, the classifications for tax purposes and disposal purposes differ and currently all made ground and topsoil is taxable at the 'standard' rate and only naturally occurring soil and stones, which are accurately described as such in terms of the 2011 Order, would qualify for the 'lower rate' of landfill tax.

Based on the technical guidance provided by the Environment Agency it is considered likely that the soils encountered during this ground investigation, as represented by the chemical analyses carried out, would be generally classified as follows;

Soil Type	Waste Classification (Waste Code)	WAC Testing Required Prior to Landfill Disposal?	Comments
Made ground	Non-hazardous (17 05 04)	No	-
Lynch Hill Gravel & London Clay	Inert (17 05 03)	Should not be required but confirm with receiving landfill	-

10 HSE (1992) HS(G)66 *Protection of workers and the general public during the development of contaminated land* HMSO

11 CIRIA (1996) *A guide for safe working on contaminated sites* Report 132, Construction Industry Research and Information Association

12 Environment Agency 2015. *Guidance on the classification and assessment of waste.* Technical Guidance WM3 First Edition

13 CL:AIRE March 2011. *The Definition of Waste: Development Industry Code of Practice* Version 2

Under the requirements of the European Waste Directive all waste needs to be pre-treated prior to disposal. The pre-treatment process must be physical, thermal, chemical or biological, including sorting. It must change the characteristics of the waste in order to reduce its volume, hazardous nature, facilitate handling or enhance recovery. The waste producer can carry out the treatment but they will need to provide documentation to prove that this has been carried out. Alternatively, the treatment can be carried out by an approved contractor. The Environment Agency has issued a position paper[14] which states that in certain circumstances, segregation at source may be considered as pre-treatment and thus excavated material may not have to be treated prior to landfilling if the soils can be segregated onsite prior to excavation by sufficiently characterising the soils insitu prior to excavation.

The above opinion with regard to the classification of the excavated soils is provided for guidance only and should be confirmed by the receiving landfill once the soils to be discarded have been identified.

The local waste regulation department of the Environment Agency (EA) should be contacted to obtain details of tips that are licensed to accept the soil represented by the test results. The tips will be able to provide costs for disposing of this material but may require further testing

[14] Environment Agency 23 Oct 2007 *Regulatory Position Statement Treating non-hazardous waste for landfill - Enforcing the new requirement*

Part 3: GROUND MOVEMENT ANALYSIS

This section of the report comprises an analysis of the ground movements arising from the proposed basement and foundation scheme discussed in Part 2 and the information obtained from the investigation, presented in Part 1 of the report.

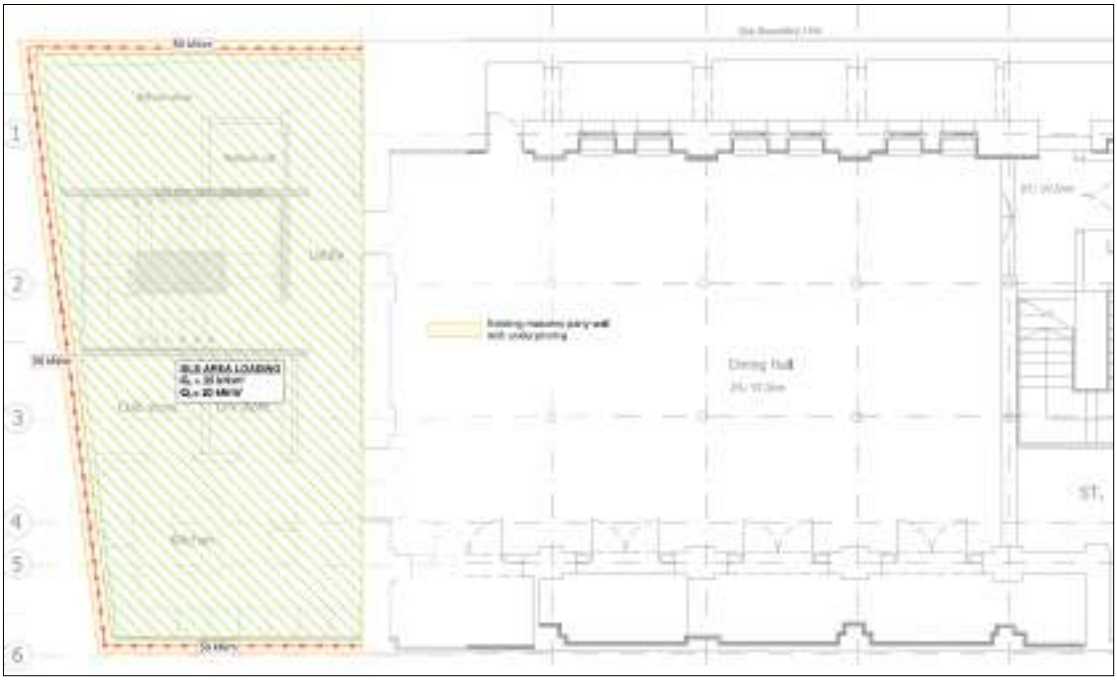
9.0 INTRODUCTION

The sides of a basement excavation will move to some extent regardless of how they are supported. The movement will typically be both horizontal and vertical and will be influenced by the engineering properties of the ground, groundwater level and flow, the efficiency of the various support systems employed during underpinning and the efficiency or stiffness of any support structures used to form the basement.

An analysis has been carried out of the likely movements arising from the proposed basement excavation and the results of this analysis have been used to predict the effect of these movements on surrounding structures.

9.1 Construction Sequence

The proposed basement layout is shown in the diagram below, which has been annotated with the proposed loading.



For the purposes of the ground movement assessment the depth of foundations and heights of sensitive structures have been measured from ground level. During the site walkover, an engineer from GEA looked at the adjacent properties to check for the presence of existing basements. The majority of the buildings nearby are known to have a basement which are assumed to be single level extending to a depth of 3.00 m. These properties include;

- Russell Square Mansions;

- 114-118 Southampton Row;
- Ormonde House;
- Part of No 26 Old Gloucester Street, and;
- No 27 Old Gloucester Street.

Where the buildings do not obviously have a basement, it has been assumed that they do not have a basement and that the foundations of the buildings extend to a depth of 0.50 m to provide a conservative analysis.. All of the surrounding building have been assumed to not have basements and the foundations of the buildings have been assumed to extend to a depth of 0.50 m to provide a conservative analysis.

It is proposed to construct the new basement using traditional reinforced concrete underpinning methods to a depth of about 3.00 m beneath the rear section of the existing building. The remainder of the building already has a basement extending to a similar depth.

The sequence of construction operations has been provided by Parmarbrook, the consulting engineers for the project, to enable the accurate analysis of the ground movements around the proposed basement both during and after construction. This sequence has been summarised below.

1. Construct underpinned retaining walls. The underpins are commonly formed in a 'hit and miss' sequence using a trench box excavation, commonly sheet lined, shored and strutted; all temporary shoring and propping to be inspected by a suitably qualified person; and

2. excavate new basement and temporarily retain and strengthen, with sufficient propping and walling beams, the new retaining walls. Construct new ground slab.

The underpins will be adequately laterally propped and sufficiently dowelled together, and the concrete will be cast and adequately cured prior to excavation of the basement and removal of the formwork and supports. If the sides of the underpin excavations do not stand stable unsupported before the concrete is poured sacrificial boards will be put in place to provide support to the excavation. It is assumed that the corners of the excavation will be locally stiffened by cross-bracing or similar and that the new retaining walls will not be cantilevered at any stage during the construction process. It is assumed that adequate temporary propping of the new retaining walls, particularly at the top level, will occur at all times prior to the construction of permanent concrete floor slabs.

The detail of the support provided to adjacent walls is beyond the scope of this report at this stage and the structural engineer will be best placed to agree a methodology with the underpinning contractor once appointed.

When the final excavation depths have been reached the permanent works will be formed, which are likely to comprise reinforced concrete walls with a drained cavity lining the inside of the underpinned walls. A reinforced concrete raft slab foundation is to be adopted and following construction of the raft slab the temporary props will be removed.

9.2 Ground Movements

An assessment of ground movements within and surrounding the excavation has been undertaken using the P-Disp Version 19.3 – Build 12 package licensed from the OASYS suite of geotechnical modelling software from Arup. This program is commonly used within the ground engineering industry and is considered to be an appropriate tool for the analysis of an underpinned retained wall.

Published data for ground movements associated with underpinned retaining walls and subsequent excavation of a new basement is limited compared to other types of retaining wall. It is possible to use the well-documented predictions and movement curves for embedded retaining walls contained within CIRIA C760, although this approach is considered to be unnecessarily conservative. A manual approach has therefore been adopted in conjunction with the results of a P-Disp analysis to assess the effects of the construction of the proposed underpinned retaining walls and the subsequent excavation of the new basement in granular soils.

9.3 P-Disp Model

At this site, unloading of the London Clay at depth will take place as a result of the installation of the proposed underpinned retaining walls and excavation of the new basement, such that the reduction in vertical stress in the short term will cause heave to take place. Undrained soil parameters have been used to estimate the potential short term movements, which include the "immediate" or elastic movements as a result of the basement excavation. The model is based on the assumption that the soils behave elastically, which provides a reasonable approximation to soil behaviour at small strains. Drained parameters have been used to provide an estimate of the total movement, which includes long term swelling that will continue for a number of years.

The elastic analysis requires values of soil stiffness at various levels to calculate displacements. Values of stiffness for the soils at this site are readily available from published data and we have used a well-established method to provide our estimates. This relates values of E_u and E', the drained and undrained stiffness respectively, to values of undrained cohesion, as described by Padfield and Sharrock[15] and Butler[16] and more recently by O'Brien and Sharp[17]. Relationships of $E_u = 500\ C_u$ and $E' = 300\ C_u$ for the cohesive soils have been used to obtain values of Young's modulus. More recent published data[18] indicates stiffness values of 750 x Cu for the London Clay and a ratio of E' to Eu of 0.75, and it is considered that the use of the more conservative values provides a sensible approach for this stage in the design. The profile of the London Clay below the depth of the borehole has been interpolated from the ground investigation by GEA that was previously carried out at nearby sites.

For the purpose of this analysis, the corners have been defined by x and y coordinates, with the y-direction is parallel with the orientation of Old Gloucester Street, whilst the x-direction is orientated perpendicular to Old Gloucester Street. Vertical movement is in the z-direction. All wall lengths have been modelled as 1 m long structural elements to provide a conservative assessment. The full outputs of all the analyses and P-Disp movement contour plots are included within the appendix. The proposed basement excavation will result in a short term

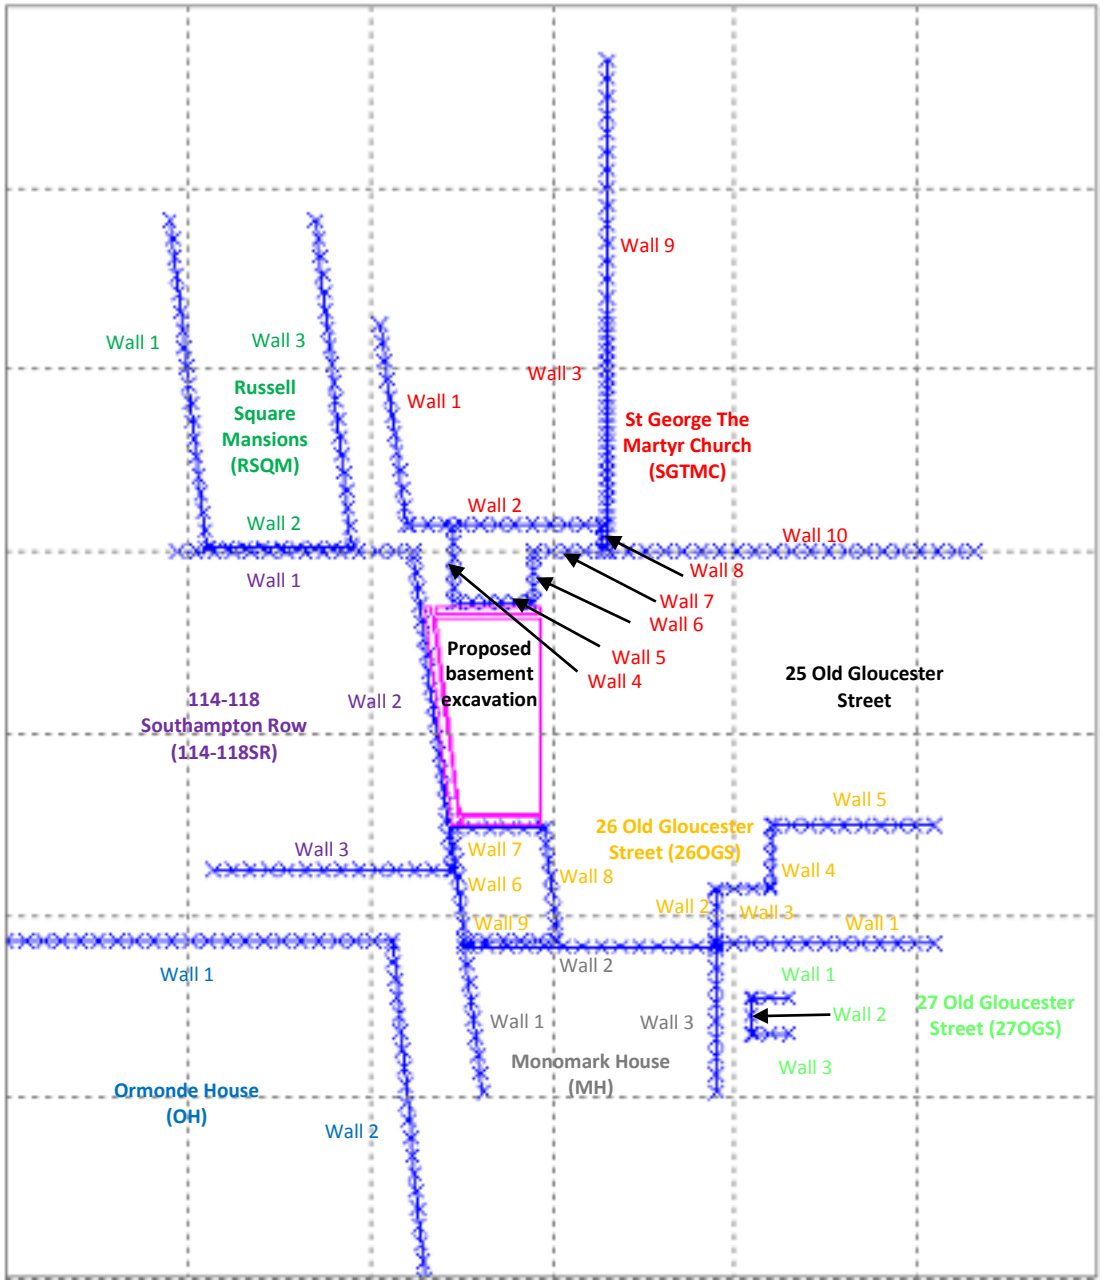
17 O'Brien AS and Sharp P (2001) *Settlement and heave of overconsolidated clays - a simplified non-linear method.* Part Two, Ground Engineering, Nov 2001, 48-53
18 Burland JB, Standing, JR, and Jardine, FM (2001) *Building response to tunnelling, case studies from construction of the Jubilee Line Extension* CIRIA Special Publication 200

unloading of around 55 kN/m^2, which is assumed to act at the excavation depth of 3.00 m below existing ground level.

The soil parameters used in this assessment are tabulated below. A rigid boundary for the analysis has been set at a depth of 39 m below ground level, which is considered to be the bottom of the Lambeth Group beneath the site, below which significant movements would not be expected.

Stratum	Depth range (m)	Eu (MPa)	E' (MPa)
Made Ground	GL to 3.0	12.0	12.0
Lynch Hill Gravel	3.0 to 6.5	88.0	88.0
London CLay	6.5 to 18.0	47.5 to 95.0	28.5 to 57.0
Lambeth Group	18.0 to 39.0	95.0 to 180.0	57.0 to 108.0



9.4 Ground Movements – Surrounding the Basement

The magnitude of the settlement resulting from the proposed basement construction will be controlled to a large extent by the quality of workmanship of the underpins and by the existing building that is likely to provide additional rigidity.

For the purpose of this assessment a high quality of construction has been assumed, with continued loading from the existing building and propping of the proposed excavations, such that potential movements are expected to be kept to a minimum.

9.4.1 Installation Phase

For the X-Disp analysis, the installation curves for a panel-like planar diaphragm wall have been adopted as most appropriate for the soil movement relationship for walls installed by underpinning techniques.

9.4.2 Excavation Phase

Settlement of the soil behind the new retaining wall may occur due to the excavation in front of the wall causing the wall to deflect. The walls will be fully top propped for the duration of the excavation on exposure, such that potential deflections during the excavation phase are not considered to be significant. However, as reinforced concrete retaining walls will be adopted for part of the proposed basement, the ground movement curve for 'excavation in front of a stiff wall in stiff clay' have been adopted for both the horizontal and vertical movements to provide a conservative assessment and account for any potential movements.

9.4.3 Results

The movements predicted by the X-Disp analysis for the new basement extension are summarised in the table below; the results are presented below, and in subsequent tables, to the degree of accuracy required to allow predicted variations in ground movements around the structure to be illustrated, but may not reflect the anticipated accuracy of the predictions.

Short term movements – Retaining Wall Construction

Phase of Works	Wall Movement (mm)*	
	Vertical Heave / Settlement	Horizontal Movement
Immediately behind wall	1.5	1.50
At 5 m from wall	<1.0	<1.0
At 10 m from wall	<1.0	<1.0

**A positive number denotes settlement, whilst a negative number denotes heave.*

Short term movements – Complete Construction

Phase of Works	Wall Movement (mm)*	
	Vertical Heave / Settlement	Horizontal Movement
Immediately behind wall	1.50	6.0
At 5 m from wall	<1.0	3.0
At 10 m from wall	<1.0	<1.0

**A positive number denotes settlement, whilst a negative number denotes heave.*

Total movements

Phase of Works	Wall Movement (mm)*	
	Vertical Heave / Settlement	Horizontal Movement
Immediately behind wall	3.00	6.0
At 5 m from wall	1.50	3.0
At 10 m from wall	<1.0	<1.0

**A positive number denotes settlement, whilst a negative number denotes heave.*

The estimated movements are considered to represent a worst-case scenario, particularly as the movements resulting from basement excavation will be minimised due to control of the propping in the temporary works and a regime of monitoring.

9.5 Movements within the Excavation

Results

Using the same P-Disp model, the analysis indicates that, by the time the basement excavation is complete, around 5 mm of heave is likely to have taken place at the centre of the proposed excavation, reducing to between 1 mm and 3 mm of settlement beneath the retaining walls. In the long term, as the loads of the building are similar to that of the soil removed, the pressure of the raft slab the movements will reduce to an overall heave at the centre of the basement to a further 2 mm. Beneath the proposed retaining walls a further heave movements will be limited to less than 1 mm.

10.0 BUILDING DAMAGE ASSESSMENT

In addition to the above assessment of the likely movements that will result from the proposed development, any neighbouring buildings within the zone of influence of the excavations are considered to be sensitive structures, requiring Building Damage Assessments, on the basis of the classification given in Table 6.4 of CIRIA report C760[19].

All structures are shown on the plan in Section 9.3.

10.1 Damage to Neighbouring Structures

The ground movements calculated using X-Disp have been used to carry out an assessment of the likely damage to adjacent properties, whereby the vertical heave and settlement movements along each sensitive structure have been used to estimate the deflection ratio of the nearby sensitive structures. The results of the building damage assessment are shown in the table below.

Structure	Wall Reference	Preliminary Assessment of Damage Category*
St George The Martyr Church (SGTMC)	Wall 1	Category 0 - Negligible
	Wall 2	Category 0 - Negligible
	Wall 3	Category 0 - Negligible

[19] Gaba, A, Hardy, S, Powrie, W, Doughty, L and Selemetas, D (2017) Embedded *retaining walls – guidance for economic design CIRIA* Report C760

Structure	Wall Reference	Preliminary Assessment of Damage Category*
	Wall 4	Category 1 – Very Slight
	Wall 5	Category 0 – Negligible
	Wall 6	Category 1 – Very Slight
	Wall 7	Category 0 - Negligible
	Wall 8	Category 0 – Negligible
	Wall 9	Category 0 - Negligible
	Wall 10	Category 0 - Negligible
Russell Square Mansions (RSQM)	Wall 1	Below Sensitivity Limit
	Wall 2	Category 0 - Negligible
	Wall 3	Category 0 - Negligible
114-118 Southampton Row (114-118SR)	Wall 1	Category 0 - Negligible
	Wall 2	Category 0 – Negligible
	Wall 3	Category 0 - Negligible
Ormonde House (OH)	Wall 1	Category 0 - Negligible
	Wall 2	Category 0 - Negligible
Monomark House (MH)	Wall 1	Category 0 - Negligible
	Wall 2	Category 0 - Negligible
	Wall 3	Below Sensitivity Limit
27 Old Gloucester Street (27OGS)	Wall 1	Below Sensitivity Limit
	Wall 2	Below Sensitivity Limit
	Wall 3	Below Sensitivity Limit
26 Old Gloucester Street (26OGS)	Wall 1	Below Sensitivity Limit
	Wall 2	Below Sensitivity Limit
	Wall 3	Below Sensitivity Limit
	Wall 4	Category 0 - Negligible
	Wall 5	Below Sensitivity Limit
	Wall 6	Category 0 – Negligible

Structure	Wall Reference	Preliminary Assessment of Damage Category*
	Wall 7	Category 0 – Negligible
	Wall 8	Category 0 – Negligible to Category 1 – Very Slight
	Wall 9	Category 0 – Negligible

**From Table 6.4 of C760[1]: Classification of visible damage to walls.*

The analysis has predicted that the proposed installation of the retaining wall underpins and excavation of the proposed basement may result in the building damage for sensitive structures of Category 0 (negligible) to Category 1 (very slight).

The CPG Basements document indicates that where possible all building damage should be restricted to a maximum of Category 1, as set out in CIRIA Report 760. Therefore any damage to nearby structures due to the basement construction should be within tolerable limits.

10.2 Monitoring of Ground Movements

The predictions of ground movement based on the ground movement analysis should be checked by monitoring of adjacent properties and structures. The structures to be monitored during the construction stages should include the existing building and neighbouring structures. Condition surveys of the existing structures should be carried out before and after the proposed works.

The precise monitoring strategy will be developed at a later stage and it will be subject to discussions and agreements with the owners of the adjacent properties and structures. Contingency measures will be implemented if movements of the adjacent structures exceed predefined trigger levels. Both contingency measures and trigger levels will need to be developed within a future monitoring specification for the works.

11.0 BASEMENT IMPACT ASSESSMENT

The screening identified a number of potential impacts. The desk study and ground investigation information has been used to review the potential impacts, to assess the likelihood of them occurring and the scope for reasonable engineering mitigation.

The table below summarises the previously identified potential impacts and the additional information that is now available from the previous site investigation in consideration of each impact.

Potential Impact	Site Investigation Conclusions
The site is located directly above an aquifer	The site lies directly above a Secondary 'A' Aquifer but the investigation has indicated that the groundwater table is located 1 m below the proposed basement level. In addition, the investigation was carried out towards then end of winter when groundwater levels would be at their highest. No evidence of permeable contamination was recorded during the investigation and as a result, no additional engineering precautions should need to be made in this respect.
The development will increase the founding depths relative to neighbours.	The retention system will ensure the stability of the excavation and neighbouring properties at all times.

The results of the site investigation have been used below to review the remaining potential impacts, to assess the likelihood of them occurring and the scope for reasonable engineering mitigation.

The site is located directly above an aquifer.

There is a potential for groundwater to be present within the Secondary 'A' Aquifer beneath the site. This could arise to water ingress into the basement excavation and cause instabilities and difficulties during construction. Groundwater was not encountered during drilling and groundwater was subsequently measured at a depth of 4.50 m within one of the standpipes while the other standpipes were found to be dry. In addition, most of the site is already underlain by a basement extending to a similar depth as the proposed basement and the existing basement does not appear to have experienced any problems. As a result, it is deemed the proposed basement will not have any effect on groundwater flow, and that no significant perched groundwater inflows, that can't be dealt with by standard sump pumping, will be encountered.

The proposed basement will significantly increase differential depth of foundations to neighbouring properties

At the time of writing this report the presence of neighbouring basements and founding levels is not known for all possibly affected buildings. To this extent and to remain conservative it has been assumed that any surrounding properties that do not clearly have a basement from observations made during the site walkover do not have basements and are founded on shallow foundations. Therefore, the proposed basement will extend to a significant depth relative to the existing foundations of the neighbouring properties and will need to be designed to ensure the stability of the site and any potentially sensitive structures that are in close proximity to the site.

The results of the Ground Movement Analysis and building damage assessment have indicated that the movements arising on adjacent structures as a result of the development can be maintained within tolerable limits by careful control of movements.

11.1 BIA Conclusion

A Basement Impact Assessment has been carried out following the information and guidance published by the London Borough of Camden. Information from the site investigation has been used to assess potential impacts identified by the screening process.

It is concluded that the proposed development is unlikely to result in any specific land or slope stability issues, groundwater or surface water issues.

11.2 Non-Technical Summary of Evidence

This section provides a short summary of the evidence acquired and used to form the conclusions made within the BIA.

11.2.1 Screening

The following table provides the evidence used to answer the surface water flow and flooding screening questions.

Question	Evidence
1. Is the site within the catchment of the pond chains on Hampstead Heath?	Figures 12 and 14 of the Arup report.
2. As part of the proposed site drainage, will surface water flows (e.g. volume of rainfall and peak run-off) be materially changed from the existing route?	A site walkover and existing plans of the site have confirmed that the proposed basement scheme will not increase the amount of hardstanding.
3. Will the proposed basement development result in a change in the proportion of hard surfaced / paved areas?	
4. Will the proposed basement development result in changes to the profile of the inflows (instantaneous and long term) of surface water being received by adjacent properties or downstream watercourses?	As above.
5. Will the proposed basement result in changes to the quantity of surface water being received by adjacent properties or downstream watercourses?	
6. Is the site in an area known to be at risk from surface water flooding such as South Hampstead, West Hampstead, Gospel Oak and Kings Cross, or is it at risk of flooding because the proposed basement is below the static water level of a nearby surface water feature?	Flood risk maps acquired from the Environment Agency as part of the desk study, Figure 15 of the Arup report, the Camden Flood Risk Management Strategy dated 2013 and SFRA dated 2014.

The following table provides the evidence used to answer the subterranean (groundwater flow) screening questions.

Question	Evidence
1a. Is the site located directly above an aquifer?	Aquifer designation maps acquired from the Environment Agency as part of the desk study and Figures 3, 5 and 8 of the Arup report.
1b. Will the proposed basement extend beneath the water table surface?	Site investigation.
2. Is the site within 100 m of a watercourse, well (used/ disused) or potential spring line?	Historical maps acquired as part of the desk study and Figures 11 and 12 of the Arup report.
3. Is the site within the catchment of the pond chains on Hampstead Heath?	Figures 12 and 14 of the Arup report.
4. Will the proposed basement development result in a change in the proportion of hard surfaced / paved areas?	A site walkover and existing plans of the site have confirmed that the basement development will only replace existing hardstanding areas.
5. As part of the site drainage, will more surface water (e.g. rainfall and run-off) than at present be discharged to the ground (e.g. via soakaways and/or SUDS)?	The details of the proposed development do not indicate the use soakaway drainage.
6. Is the lowest point of the proposed excavation (allowing for any drainage and foundation space under the basement floor) close to or lower than, the mean water level in any local pond or spring line?	Topographical maps acquired as part of the desk study and Figures 11 and 12 of the Arup report.

The following table provides the evidence used to answer the slope stability screening questions.

Question	Evidence
1. Does the existing site include slopes, natural or manmade, greater than 7°?	Site survey drawing and Figures 16 and 17 of the Arup report and confirmed during a site walkover
2. Will the proposed re-profiling of landscaping at the site change slopes at the property boundary to more than 7°?	The details of the proposed development provided do not include the re-profiling of the site to create new slopes.
3. Does the development neighbour land, including railway cuttings and the like, with a slope greater than 7°?	Topographical maps and Figures 16 and 17 of the Arup report and confirmed during a site walkover
4. Is the site within a wider hillside setting in which the general slope is greater than 7°?	
5. Is the London Clay the shallowest strata at the site?	Geological maps and Figures 3, 5 and 8 of the Arup report
6. Will any trees be felled as part of the proposed development and / or are any works proposed within any tree protection zones where trees are to be retained?	There are no known plans to remove any trees and an arboriculturist should be consulted to ensure no damage to tree roots and if trees are to be removed
7. Is there a history of seasonal shrink-swell subsidence in the local area and / or evidence of such effects at the site?	Knowledge on the ground conditions of the area and reference to NHBC guidelines were used to make an assessment of this, in addition to a visual inspection of the buildings carried out during the site walkover
8. Is the site within 100 m of a watercourse or potential spring line?	Topographical maps acquired as part of the desk study and Figures 11 and 12 of the Arup report and the Lost Rivers of London book.
9. Is the site within an area of previously worked ground?	Geological maps and Figures 3, 5 and 8 of the Arup report
10. Is the site within an aquifer?	Aquifer designation maps acquired from the Environment Agency as part of the desk study and Figures 3, 5 and 8 of the Arup report.
11. Is the site within 50 m of Hampstead Heath ponds?	Topographical maps acquired as part of the desk study and Figures 12 and 14 of the Arup report.
12. Is the site within 5 m of a highway or pedestrian right of way?	Site plans and the site walkover.
13. Will the proposed basement significantly increase the differential depth of foundations relative to neighbouring properties?	Camden planning portal and the site walkover confirmed the position of the proposed basement relative the neighbouring properties.
14. Is the site over (or within the exclusion zone of) any tunnels, e.g. railway lines?	Maps and plans of infrastructure tunnels were reviewed.

11.2.2 Scoping and Site Investigation

The questions in the screening stage that there were answered ‘yes’, were taken forward to a scoping stage and the potential impacts discussed in Section 4.0 of this report, with reference to the possible impacts outlined in the Arup report.

A ground investigation has been carried out, which has allowed an assessment of the potential impacts of the basement development on the various receptors identified from the screening and scoping stages. Principally the investigation aimed to establish the ground conditions, including the groundwater level and the engineering properties of the underlying soils to enable suitable design of the basement development. The findings of the investigation are discussed in Part 2 of this report and summarised in the Executive Summary.

11.2.3 Impact Assessment

Section 10.0 of this report summarises whether or not, on the basis of the findings of the investigation, the potential impacts still need to be given consideration and identifies ongoing

risks that will require suitable engineering mitigation. Section 9.0 of this report also provides recommendations for the design of the proposed development.

A ground movement analysis and building damage assessment has been commissioned and will be used to provide a conclusion on any potential impacts from the proposed basement development to the surrounding structures.

12.0 OUTSTANDING RISKS AND ISSUES

This section of the report aims to highlight areas where further work is required as a result of limitations on the scope of this investigation, or where issues have been identified by this investigation that warrant further consideration. The scope of risks and issues discussed in this section is by no means exhaustive, but covers the main areas where additional work is considered to be required.

The ground is a heterogeneous natural material and variations will inevitably arise between the locations at which it is investigated. This report provides an assessment of the ground conditions based on the discrete points at which the ground was sampled, but the ground conditions should be subject to review as the work proceeds to ensure that any variations from the Ground Model are properly assessed by a suitably qualified person.

Groundwater monitoring should be continued out to confirm that significant groundwater inflows will not be encountered during basement excavation as well as trial excavations, ideally, to depths as close to the full basement depth as possible.

If during ground works any visual or olfactory evidence of contamination is identified it is recommended that further investigation be carried out and that the risk assessment is reviewed. These areas of doubt should be drawn to the attention of prospective contractors and further investigation will be required or sufficient contingency should be provided to cover the outstanding risk.

Analytical Report Number : 17-43874

Project / Site name:	25 Old Gloucester Street	**Samples received on:**	27/03/2017
Your job number:	J17059	**Samples instructed on:**	27/03/2017
Your order number:	J17059	**Analysis completed by:**	31/03/2017
Report Issue Number:	1	**Report issued on:**	31/03/2017
Samples Analysed:	4 soil samples		

Signed:

Dr Irma Doyle
Senior Account Manager
For & on behalf of i2 Analytical Ltd.

Standard Geotechnical, Asbestos and Chemical Testing Laboratory located at: ul. Pionierów 39, 41 -711 Ruda Śląska, Poland.

Accredited tests are defined within the report, opinions and interpretations expressed herein are outside the scope of accreditation.

Standard sample disposal times, unless otherwise agreed with the laboratory, are :

soils	- 4 weeks from reporting
leachates	- 2 weeks from reporting
waters	- 2 weeks from reporting
asbestos	- 6 months from reporting

Excel copies of reports are only valid when accompanied by this PDF certificate.

* These descriptions are only intended to act as a cross check if sample identities are questioned. The major constituent of the sample is intended to act with respect to MCERTS validation. The laboratory is accredited for sand, clay and loam (MCERTS) soil types. Data for unaccredited types of solid should be interpreted with care.

Stone content of a sample is calculated as the % weight of the stones not passing a 10 mm sieve. Results are not corrected for stone content.

Lab Sample Number	Sample Reference	Sample Number	Depth (m)	Sample Description *
724515	TP3	None Supplied	0.40	Brown clay and loam with gravel and rubble.
724516	TP1	None Supplied	0.30	Brown loam and sand with gravel and brick.
724517	TP2	None Supplied	0.60	Light brown loam and sand with rubble.
724518	BH3	None Supplied	0.10	Light brown loam and sand with gravel and rubble.

Analytical Report Number : 17-43874

Project / Site name: 25 Old Gloucester Street

Water matrix abbreviations: Surface Water (SW) Potable Water (PW) Ground Water (GW)

Analytical Test Name	Analytical Method Description	Analytical Method Reference	Method number	Wet / Dry Analysis	Accreditation Status
Asbestos identification in soil	Asbestos Identification with the use of polarised light microscopy in conjunction with disperion staining techniques.	In house method based on HSG 248	A001-PL	D	ISO 17025
Chloride, water soluble, in soil	Determination of Chloride colorimetrically by discrete analyser.	In-house method based on BS1377 Part 3, 1990, Chemical and Electrochemical Tests. 2:1 extraction.	L082-PL	D	MCERTS
Metals in soil by ICP-OES	Determination of metals in soil by aqua-regia digestion followed by ICP-OES.	In-house method based on MEWAM 2006 Methods for the Determination of Metals in Soil.	L038-PL	D	MCERTS
Moisture Content	Moisture content, determined gravimetrically.	In-house method based on BS1377 Part 2, 1990, Chemical and Electrochemical Tests	L019-UK/PL	W	NONE
Monohydric phenols in soil	Determination of phenols in soil by extraction with sodium hydroxide followed by distillation followed by colorimetry.	In-house method based on Examination of Water and Wastewater 20th Edition: Clesceri, Greenberg & Eaton (skalar)	L080-PL	W	MCERTS
pH in soil (automated)	Determination of pH in soil by addition of water followed by automated electrometric measurement.	In-house method based on BS1377 Part 3, 1990, Chemical and Electrochemical Tests	L099-PL	D	MCERTS
Speciated EPA-16 PAHs in soil	Determination of PAH compounds in soil by extraction in dichloromethane and hexane followed by GC-MS with the use of surrogate and internal standards.	In-house method based on USEPA 8270	L064-PL	D	MCERTS
Stones content of soil	Standard preparation for all samples unless otherwise detailed. Gravimetric determination of stone > 10 mm as % dry weight.	In-house method based on British Standard Methods and MCERTS requirements.	L019-UK/PL	D	NONE
Sulphate, water soluble, in soil (16hr extraction)	Determination of water soluble sulphate by ICP-OES. Results reported directly (leachate equivalent) and corrected for extraction ratio (soil equivalent).	In-house method based on BS1377 Part 3, 1990, Chemical and Electrochemical Tests, 2:1 water:soil extraction, analysis by ICP-OES.	L038-PL	D	MCERTS
Sulphide in soil	Determination of sulphide in soil by acidification and heating to liberate hydrogen sulphide, trapped in an alkaline solution then assayed by ion selective electrode.	In-house method	L010-PL	D	MCERTS
Total cyanide in soil	Determination of total cyanide by distillation followed by colorimetry.	In-house method based on Examination of Water and Wastewater 20th Edition: Clesceri, Greenberg & Eaton (Skalar)	L080-PL	W	MCERTS
Total organic carbon in soil	Determination of organic matter in soil by oxidising with potassium dichromate followed by titration with iron (II) sulphate.	In-house method based on BS1377 Part 3, 1990, Chemical and Electrochemical Tests	L023-PL	D	MCERTS
Total sulphate (as SO4 in soil)	Determination of total sulphate in soil by extraction with 10% HCl followed by ICP-OES.	In-house method based on BS1377 Part 3, 1990, Chemical and Electrochemical Tests	L038-PL	D	MCERTS
TPH Banding in Soil by FID	Determination of hexane extractable hydrocarbons in soil by GC-FID.	In-house method, TPH with carbon banding.	L076-PL	W	MCERTS
TPH in (Soil)	Determination of TPH bands by HS-GC-MS/GC-FID	In-house method, TPH with carbon banding.	L076-PL	D	MCERTS

For method numbers ending in 'UK' analysis have been carried out in our laboratory in the United Kingdom.
For method numbers ending in 'PL' analysis have been carried out in our laboratory in Poland.
Soil analytical results are expressed on a dry weight basis. Where analysis is carried out on as-received the results obtained are multiplied by a moisture correction factor that is determined gravimetrically using the moisture content which is carried out at a maximum of 30oC.

Notes

Concentrations measured below the above values may be considered to represent 'uncontaminated conditions' which pose 'LOW' risk to human health. Concentrations measured in excess of these valuesindicate a potential risk which require further, site specific risk assessment.

SGV - Soil Guideline Value, derived from the CLEA model and published by Environment Agency 2009

LQM/CIEH - Generic Assessment Criteria for Human Health Risk Assessment 2nd edition (2009)derived using CLEA 1.04 model 2009

C4SL - Defra Category 4 Screening value based on Low Level of Toxicological Risk

C4SL exp & LQM/CIEH calculated using C4SL revisions to exposure assessment but LQM/CIEH health croiteria values

Calc - sum of nearest available carbon range specified including BTEX for PRO fraction

B(a)P / 0.15 - GEA experince indicates that Benzo(a) pyrene (one of the most common and most carcenogenic of the PAHs) rarely exceeds 15% of the total PAH concentration, hence this Total PAH threshold is regarded as being conservative

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination.
For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client.

In the attached datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

London

Published 1875 - 1878

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Published 1882

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940`s, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

London

Published 1920

Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940`s, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Supply of Unpublished Survey Information

Published 1974 - 1976

Source map scale - 1:1,250

SUSI maps (Supply of Unpublished Survey Information) were produced between 1972 and 1977, mainly for internal use at Ordnance Survey. These were more of a `work-in-progress' plan as they showed updates of individual areas on a map. These maps were unpublished, and they do not represent a single moment in time. They were produced at both 1:2,500 and 1:1,250 scales.

Large-Scale National Grid Data

Published 1991

Source map scale - 1:1,250

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

10k Raster Mapping

Published 1999

Source map scale - 1:10,000

The historical maps shown were produced from the Ordnance Survey`s 1:10,000 colour raster mapping. These maps are derived from Landplan which replaced the old 1:10,000 maps originally published in 1970. The data is highly detailed showing buildings, fences and field boundaries as well as all roads, tracks and paths. Road names are also included together with the relevant road number and classification. Boundary information depiction includes county, unitary authority, district, civil parish and constituency.

VectorMap Local

Published 2017

Source map scale - 1:10,000

VectorMap Local (Raster) is Ordnance Survey's highest detailed 'backdrop' mapping product. These maps are produced from OS's VectorMap Local, a simple vector dataset at a nominal scale of 1:10,000, covering the whole of Great Britain, that has been designed for creating graphical mapping. OS VectorMap Local is derived from large-scale information surveyed at 1:1250 scale (covering major towns and cities),1:2500 scale (smaller towns, villages and developed rural areas), and 1:10 000 scale (mountain, moorland and river estuary areas).

1 - Data point coincident with displacement location. Its displacement has been added to those calculated by Xdisp.
2 - Data point coincident with horizontal movement calculation point for a specific building. Its displacement has been added before performing building damage calculations.
6 - Data point coincident with vertical movement calculation point for a specific building. Its displacement has been added before performing building damage calculations.

Polygonal Excavations

Warnings

1 Displacement grid 1 and displacement grid 2 have the same name.
2 Multiple excavations have been specified. Displacements resulting from each excavation are summed with no account taken of the interactions between excavations (e.g. overlapping zones of influence or 'shielding' of one excavation by another).

Errors

None

Geotechnical & Environmental Associates (GEA) is an engineer-led and client-focused independent specialist providing a complete range of geotechnical and contaminated land investigation, analytical and consultancy services to the property and construction industries.

We have offices at

Widbury Barn
Widbury Hill
Ware
Hertfordshire
SG12 7QE
tel 01727 824666
mail@gea-ltd.co.uk

Church Farm
Gotham Road
Kingston on Soar
Notts
NG11 0DE
tel 01509 674888
midlands@gea-ltd.co.uk

Peter House
Oxford Street
Manchester
M1 5AN

tel 0161 209 3032
mail @ gea-ltd.co.uk

Enquiries can also be made online at

www.gea-ltd.co.uk

where information can be found
on all of the services that we offer.
