

If the centre of the neighbour's window lies on the extension side of both of the 45° lines (on plan and elevation), then the more detailed BRE tests are required. Otherwise, daylight and sunlight levels are unlikely to be adversely affected because light will continue to be received either over the roof, or beyond the end of the extension.

45 degree test

The 45° test is used to check extensions that are perpendicular to a window - as in the example below.
