## CONSERVATION ROOFLIGHTS

## Flush Finishes

IQ's conservation rooflights are installed to sit flush with pitched roofs rather than on an upstand like most of our rooflight products. Frameless designs can be created to provide homeowners with incredible sky views without any framing obstruction.

Our conservation rooflights can be used in roof pitches between 15° and 60° with aluminium frames that can be powder coated in any RAL colour to match the rest of the home design combined with either double or triple glazing.

All fixings are accessible from the outside, meaning the rooflight can be installed to existing buildings as part of a renovation with minimal disruption to internal finishes.

IQ's conservation rooflights are perfect for most projects with a pitched roof where additional natural light is wanted or to combine a number of units adjacent to one another to create an entirely glazed ceiling.

## Traditional and Listed Properties

Conservation rooflights are more popular on traditional or listed properties due to the flush finish with very minimal or no visible framing. IQ are able to integrate glazed bars into the rooflight design to continue the more traditional design.

Although these rooflights are better suited for conservation areas, you will still need to make sure the correct sizing and amount of natural light and ventilation is provided. If your project includes a more visible sloped roof then smaller conservation rooflights may be better suited.

Installing a rooflight onto your property is one of the best ways to bring natural light into a building discretely but effectively. These rooflights in particular can distribute light to low-level structures and can brighten darker areas of a room where windows may not reach.
