EXECUTIVE SUMMARY

Verve Concepts Limited commissioned Jomas Associates Ltd to undertake a Ground Movement Assessment (buildings) at the site located at 24 Burgess Hill, London, NW2 2DA. The salient details of this commission are summarised in the table below.

Executive Summary	
Current Site Use	The site consists of a 3-storey residential building with a basement underneath the footprint of the building with an internal height of 1.68m.
Proposed Site Use/Works	The proposed development is to comprise creation of a basement under part of the existing footprint, with lightwells formed to the front and rear. Small extensions are also proposed at ground and first floor levels.
Ground Conditions	The results of the ground investigation revealed a ground profile comprising Made Ground (0.00m – 0.90m thick), overlying the London Clay Formation to a maximum proven depth of 8.0m bgl. Groundwater was not reported during drilling but return monitoring visits recorded groundwater levels of between 3.07-3.24m bgl.
Ground Movement Assessment	The Ground Movement Assessment results indicate minimal impact on adjacent properties as a result of the proposed works. The obtained damage categories vary between Category 0 - (Negligible) and Category 1 - (Very Slight) for all analysed scenarios, with respect to the Burland structural damage assessment criteria. These results are within the typical acceptable limits of anticipated structural damage for developments within the London Borough of Camden. Maximum vertical and horizontal displacements of 18.1mm and 8.2mm respectively, have been observed for the worst-case scenario representing the long-term effects of the proposed scheme. A suitable monitoring strategy and action plan should be implemented, with an allowance for mitigation measures (such as temporary propping) to ensure that movements and resultant damage are limited to acceptable levels.

It should be noted that the table above is an executive summary of the findings of this report and is for briefing purposes only. Reference should be made to the main report for detailed information and analysis.

1 INTRODUCTION

1.1 Terms of Reference

1.1.1 Verve Concepts Limited ("The Client") has commissioned Jomas Associates Ltd ('Jomas'), to undertake an assessment of the impact of the proposed development at a site referred to as 24 Burgess Hill, London, NW2 2DA, on neighbouring buildings. The assessment will inform the planning, design and construction strategies for the site.

1.1.2 To this end, a Ground Movement Assessment (GMA) was undertaken in accordance with Jomas' proposal dated 8th July 2024.

1.2 Proposed Development

1.2.1 The proposed development for this site is understood to comprise creation of a basement under part of the existing footprint, with lightwells formed to the front and rear. Small extensions are also proposed at ground and first floor levels.

1.3 Objectives

2.3 Summary of Ground Conditions

2.3.1 Ground investigations were carried out by Jomas Associates on 7th August 2024 and 3rd April 2025, comprising 2No. windowless sample boreholes, return groundwater monitoring and laboratory geotechnical testing, and 3No. window sample boreholes (report ref. P5943J3029/RAY v2.0 dated April 2025).

2.3.2 The ground investigation encountered a sequence comprising Made Ground overlying solid geology of the London Clay Formation, as summarised in Tables 2.3 and 2.4 below.

2.3.3 Deeper Made Ground deposits were encountered in the west of site. This is likely due to the topography of the surrounding area, which generally slopes down towards the west). This was evident in WS101, WS102 and WS103 being undertaken progressively further west, with corresponding deepening Made Ground.

2.3.4 Groundwater was not encountered during the fieldworks.

2.3.5 2No. return monitoring visits were undertaken on 21st and 28th August 2024. The results are summarised below.

3 GROUND MOVEMENT ASSESSMENT

3.1 Overview

3.1.1 Ground movements will arise from a number of different sources as the works progress. These ground movements will extend over a given *zone of influence* surrounding the building footprint.

3.1.2 Ground movements are associated with the proposed works, providing a simplified account of the following.

- Installation works:
  - Ground movements associated with the installation of the underpin wall around the basement perimeter.
- Long-term ground movements:
  - Ground movements associated with loading of the soil resulting from the proposed structure construction.

3.2 Methodology

3.2.1 The GMA has been carried out using the commercially available software packages P-Disp and X-Disp, produced by Oasys Software. These packages consider the three-dimensional ground movement field induced by proposed excavation and construction works.

3.2.2 For the purposes of the analysis, the soil is assumed to behave as an isotropic, linear elastic medium. Structural forces applied to the foundation are represented by applying pressures within the elastic half-space representing the foundation soils.

3.2.3 Greenfield assumptions have been adopted for this analysis, where the effects of surrounding anthropogenic structures have not been considered, i.e. the inherent stiffness of the structures under consideration has not been taken into account.

3.2.4 Wall installation effects have been modelled with the application of CIRIA C760 *Installation of planar diaphragm wall in stiff clay* for the underpin walls. Whilst the empirical data set for diaphragm wall installation is not strictly compatible with the construction technologies adopted in underpinning works, it has been assessed that the ground movement mechanisms are reasonably well matched and in lieu of better empirical relationships, the diaphragm wall curves are considered to provide a satisfactory and conservative approximation.

3.2.5 The excavation effects have been modelled with the application of the CIRIA C760 *Excavation in front of high stiffness wall in stiff clay*. The excavation height adopted for the basement is 3.0m bgl as is shown on drawings provided by White & Lloyd Consulting Engineers and Verve Concepts.

3.2.6 Excavation effects have been considered as horizontal and vertical ground movements due to excavation in front of the underpin retaining wall based on the CIRIA C760 *excavation in front of high stiffness wall in stiff clay* empirical data set.

3.2.7 The proposed building will be supported by underpinned foundations around the perimeter of the basement, assumed to be 1.5m wide. A structural loading plan has been provided and is included in Appendix 1. Line loads of between 20kN/m and 77kN/m have been provided for the underpinned foundations. As shown in Figure 3.1, these have been applied as rectangular loads to represent the induced proposed building loads on the basement perimeter walls.

3.2.8 A load of 11kN/m^2 has been applied to the floor slab based on correspondence with White & Lloyd Consulting Engineers. This is shown in Figure 3.2.

3.2.9 A series of three-dimensional models of the proposed scheme have been developed in both software packages outlined previously and have been combined by means of superposition to represent the various ground displacement fields summarised above.

3.2.10 The scenarios simulated for the assessment presented herein have encompassed the following ground movements aspects.

- **Scenario 1**: Installation of underpin wall and application of line loads only (short-term).
- **Scenario 2**: Installation of underpin wall, excavation of proposed basement and application of all structural loads (long-term).

3.2.11 The loads applied in Scenario 1 and Scenario 2 are displayed in Figures 3.1 and 3.2, respectively.

Figure 3.1: Scenario 1 Model Loading Areas in PDISP – Basement Perimeter Strips

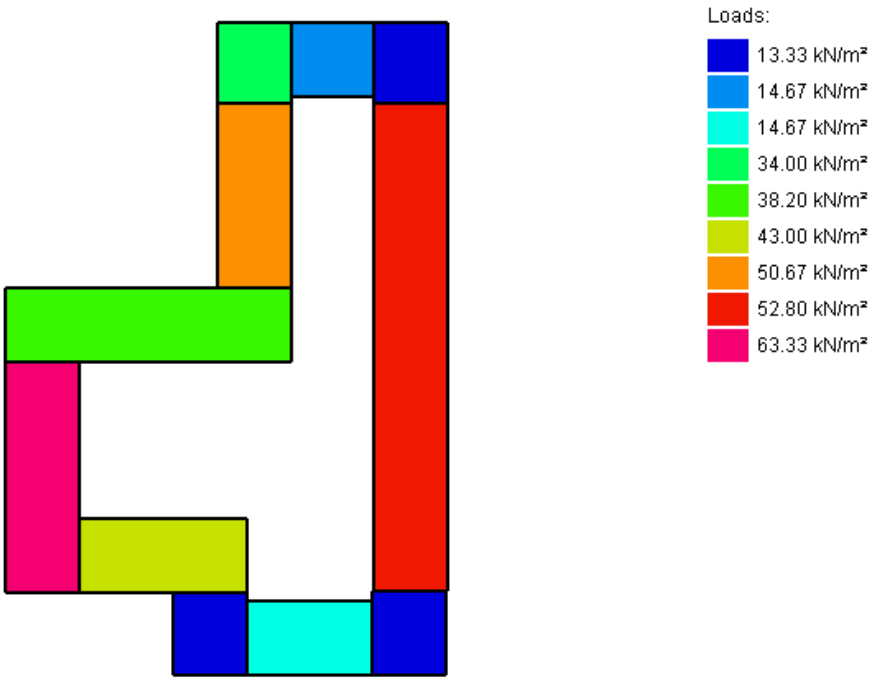

Figure 3.2: Scenario 2 Model Loading Areas in PDISP – Basement Perimeter Strips and Floor Slab

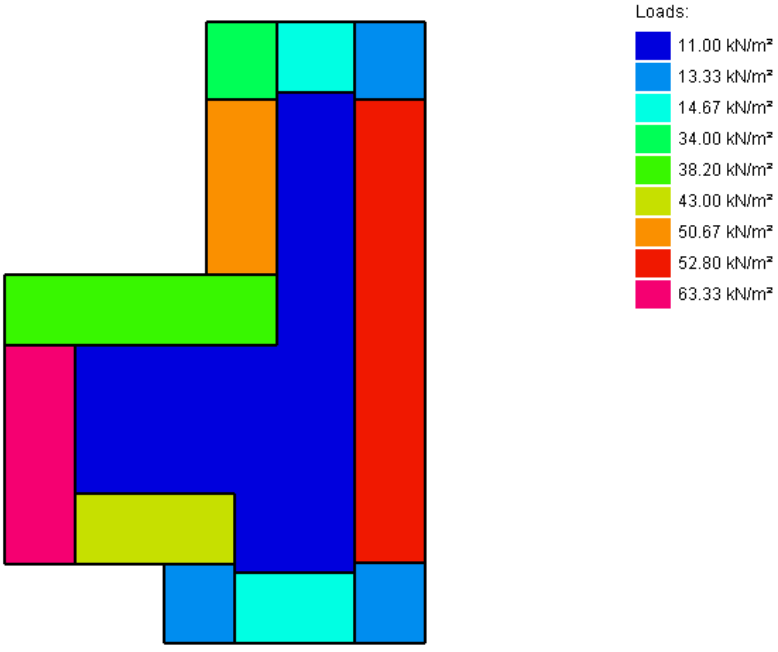

3.2.12 The potential impact/damage induced on primary façade/wall elements of the buildings within the zone of influence of the proposed scheme has been evaluated on the basis of the calculated ground movement field.

3.2.13 The buildings included in the impact assessment were identified from a screening zone of influence. The zone of influence extends approximately between 3 to 4 times the depth of excavation. At this distance, the normalised ground movement curves in CIRIA indicate low ground movement. Neighbouring properties further afield are assessed to be at low risk of adverse impact from the proposed work due to their distance from the development site. The structural walls of concern are shown in Figure 3.3.

3.2.14 Each wall has been assumed to behave as an equivalent beam subject to a bending and extension/compression deformation mechanism, based on the evaluated greenfield ground movement, as outlined previously.

3.2.15 Tensile strains induced within the building masonry walls have been evaluated based on a combination of direct tension and the deflection ratios Δ/L estimated from the analyses (Figure 3.4). The assessment considers the well-established Burland (1997) damage classification method, as presented and summarised in Figure 3.5. This method involves a simple but robust means of assessment, which is widely adopted and is considered to comprise an industry standard/best practice basis for impact assessments of this type.

3.2.16 Potential damage categories are related to the tensile strains induced by the assessed interim (short-term) and long-term phases of construction, arising from a combination of direct tension, and bending induced tension mechanisms.

Building damage classification, after Burland et al 1977 and Boscardin and Cording 1989				
Category of damage		Description of typical damage (ease of repair is underlined)	Approximate crack width (mm)	Limiting tensile strain %
0	Negligible	Hairline cracks of less than about 0.1mm are classes as negligible.	< 0.1	0.0-0.05
1	Very Slight	Fine cracks that can easily be treated during normal decoration. Perhaps isolated slight fracture in building. Cracks in external brickwork visible on inspection.	< 1	0.05-0.075
2	Slight	Cracks easily filled. Redecoration probably required. Several slight fractures showing inside of building. Cracks are visible externally and some repointing may be required externally to ensure weathertightness. Doors and windows may stick slightly.	< 5	0.075-0.15
3	Moderate	The cracks require some opening up and can be patched by a mason. Recurrent cracks can be masked by suitable linings. Repointing of external brickwork and possibly a small amount of brickwork to be replaced. Doors and windows sticking. Service pipes may fracture. Weather-tightness often impaired.	5-15 or a number of cracks >3	0.15-0.3
4	Severe	Extensive repair work involving breaking-out and replacing sections of walls, especially over doors and windows. Windows and frames distorted, floors sloping noticeably. Walls leaning or bulging noticeably, some loss of bearing in beams. Service pipes disrupted.	15-25 but also depends on number of cracks	>0.3
5	Very Severe	This requires a major repair involving partial or complete rebuilding. Beams lose bearings, walls lean badly and require shoring. Windows broken with distortion. Danger of instability.	Usually >25 but depends on number of cracks	

3.3 Ground Model

3.3.1 The stratigraphy discussed herein is based on Ground Investigation & Basement Impact Assessment for 24 Burgess Hill, London, NW2 2DA produced by Jomas (April 2025).

3.3.2 For the London Clay Formation, the undrained and drained Young's Moduli were derived using the relationships postulated by Jardine et. al (1985) where Eu=400Cu and E'=0.6Eu.

3.3.3 Where appropriate, the Cu of the London Clay Formation was correlated to the SPT N values using Stroud (1974), where $Cu=f_1N$ and f_1 is factor related to the Plasticity Index (PI) of the clay (a value of f_1 equal to 4.5 for PI>25%).

3.3.4 As described in Section 2.3, the Made Ground is deeper in the back garden and shallower at the front of the property. Therefore, two separate soil profiles have been created to reflect the proven ground conditions across the site.

3.3.5 Tables 3.1 and 3.2 presents the ground models/soil profiles adopted for the analysis.

Table 3.1: Ground model and geotechnical parameters adopted for the GMA (Soil Profile 1)

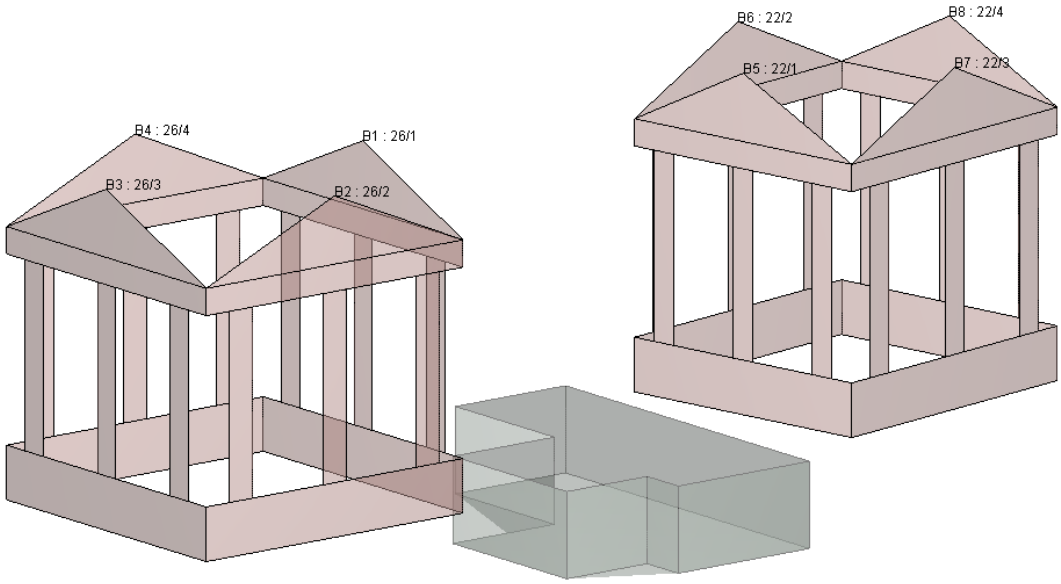
3.4 Impact Assessment Outcome

3.4.1 A perspective view of the XDisp 3D model is depicted in Figure 3.6.

Figure 3.6: Perspective view of XDisp 3D model indicating the excavation zones and neighbouring properties.



3.4.2 The initial assessment results indicate minimal impact on adjacent properties as a result of the proposed works. The obtained damage categories vary between *Category 0 (Negligible)* and *Category 1 (Very Slight)* for both analysed scenarios, with respect to the Burland structural damage assessment criteria. Table 3.3 presents the assessment results.

22/4	< Sensitivity	0 (Negligible)

Scenario 1

3.4.3 Figures 3.7 and 3.8 depict the vertical and horizontal resultant ground surface movements, respectively calculated for Scenario 1. The empirical data shows a maximum settlement of 9.2mm and maximum horizontal movement of 2.1mm at the perimeter of the excavation footprint following installation of underpinning. Figure 3.9 presents the building damage resultant from Scenario 1 as modelled in XDisp.

3.4.4 Given the minimal movements predicted for Scenario 1, all facades have been determined *Category 0 - Negligible*. Nevertheless, it is recommended that a horizontal movement of 5mm is anticipated for and taken into account for design and monitoring purposes, as it is generally accepted within the industry that 5-10mm vertical and horizontal movements will be experienced per lift of underpinning.

3.4.5 Figures 3.10 and 3.11 depict the vertical and horizontal resultant ground surface movements, respectively calculated for Scenario 2. 3.5 Discussion of Other Features

3.5.1 Apart from neighbouring buildings, there are some other features in proximity to the proposed excavation which warrant consideration of impacts. These include:

- A small retaining wall at the rear (western) boundary of the site, approximately 11.9m from the proposed basement excavation.
- A foul water sewer just beyond the western site boundary, approximately 12m from the proposed basement excavation.
- A swimming pool in the rear garden of number 26 Burgess Hill, approximately 13m from the proposed basement excavation.

3.5.2 The distance to retaining wall is as shown on drawing ref. *1033 22 A* by Verve Concepts. The distance to the sewer has been conservatively estimated based on this, as it forms the rear (western) boundary of properties along Burgess Hill. The distance to the neighbouring swimming pool has been estimated using the scaled drawing provided by the client and verified using publicly available aerial imagery.

3.5.3 In Figures 3.7, 3.8, 3.10 and 3.11, movement contours show maximum ground movements beyond ~8m from the proposed basement perimeter are expected to be <1mm. Therefore, these other features listed above are considered to be at negligible risk of ground movements resulting from the proposed basement.

4 CONCLUSIONS AND SUMMARY

4.1.1 The interaction between the proposed redevelopment works and the neighbouring properties has been reviewed as part of the Ground Movement Assessment (GMA) study presented herein.

4.1.2 The impact of the basement excavation stage of construction has been assessed with Oasys P-Disp and X-disp. Ground movements arising by wall installation effects have been taken into consideration with respect to CIRIA C760 empirical data sets. Ground movements arising by the proposed excavation works have been assessed as an overburden removal mechanism and with respect to CIRIA C760 empirical data sets.

4.1.3 From the site investigation, the geology found in the east of site comprised Made Ground to a depth of 0.9m, followed by competent London Clay Formation proven to a depth of 8.0m. In the west of site, Made Ground/reworked deposits were proven slightly deeper (1.5-2.0mbgl) overlying London Clay Formation.

4.1.4 The scenarios simulated for the assessment presented herein have encompassed the following ground movements aspects.

- **Scenario 1**: Installation of underpin wall and application of line loads only (short-term).
- **Scenario 2**: Installation of underpin wall, excavation of proposed basement and application of all structural loads (long-term).

4.1.5 The results from the analyses are presented in Figures 3.7 to 3.12.

4.1.6 The modelled damage categories vary between *Category 0 (Negligible)* and *Category 1 (Very Slight)* for both analysed scenarios, with respect to the Burland structural damage assessment criteria.

4.1.7 Maximum vertical and horizontal displacements of 18.5mm and 8.4mm respectively, have been observed for the worst-case scenario representing the long-term effects of the proposed scheme.

4.1.8 Other features including a retaining wall, foul water sewer, and swimming pool were identified within proximity of the proposed basement. However, given their respective distances from the movement contours generated, negligible impact is anticipated.

4.1.9 The design of the underpinning/earth retention system will need to be coordinated closely with the findings and performance criteria presented within this report.

4.1.10 It is noted that the predicted ground movements are considered to be moderately conservative in light of the relatively cautious ground model assumptions and *simplified greenfield* nature of the assessment undertaken.

4.1.11 The assessment presented herein is dependent and reliant on the works being undertaken by an experienced contractor, high quality workmanship and appropriate supervision of construction means and methods by experienced personnel.

4.1.12 This GMA should be supplemented by a project specific monitoring regime and Action Plan, which will delineate lines of responsibility, monitor trigger levels and appropriate mitigation measures. Condition surveys of the relevant structures should be carried out before and after the proposed works.

Warnings

1 Multiple excavations have been specified. Displacements resulting from each excavation are summed with no account taken of the interactions between excavations (e.g. overlapping zones of influence or 'shielding' of one excavation by another).

2 The following polygonal excavations have one or more re-entrant corners: 1, 2. The use of re-entrant corners is permitted but not recommended. CIRIA C580/C760, on which XDisp's method for modelling ground movements behind walls of excavations is based, considers only movements for points lying at right angles behind single walls. It does not consider how movements should be calculated within the zone of influence of re-entrant corners, i.e. where movements would be influenced by two walls adjacent to the re-entrant corner. By default, XDisp will merely sum the effects from both walls, making no allowance for interaction or stiffening of the corner. Please refer to help manual for artificial smoothing options. Re-entrant corners should be used with caution. Results in their vicinity should be validated independently.
