Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination. For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client.

In the attached datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Waterloc for infiltration and attenuation systems

As with conventional soakaways, concerns have been expressed over the tendency for the plastic cell type structures to silt up over time with no means of cleaning or removal of debris other than total removal and replacement.

However, the use of the Marley Waterloc range of components for an infiltration or attenuation scheme provides a number of benefits over conventional installation methods:

- Access to the soakaway for inspection and cleaning as recommended in BRE & CIRIA guidance notes.
- An inlet chamber for an optional filter and access to the incoming pipe connection for cleaning purposes.
- Improved inflow capacity via a single connection to the drainage system.

* Inlet pipes may also be connected to the vertical face of the cell (refer to page 35)

Waterloc for rainwater harvesting systems

Significant steps have been taken in recent years to reduce water wastage through improvements to the supply network and the introduction of more efficient water appliances. However, domestic and commercial water consumption could be significantly reduced, simply through collecting, storing and re-using rainwater at source. Not only does this reduce the use of metered water, the collection of rainwater reduces the demand on the drainage system, in turn reducing flood risk.

A modular, low cost water recycling and management system can be constructed from separate components consisting of an inlet chamber, filter unit, submersible pump unit and base unit combined with Waterloc cells to form a central filtering and pumping riser.

The system uniquely combines infiltration with recycling, thereby alleviating the problems of either water shortage or flooding. The versatility of this system means that any size and combination of storage or infiltration unit can be constructed, as long as room is allowed for the central pumping riser.

In operation, rainwater is collected from the available roof area and passed through a silt trap, UG60, before it enters the main filter in the inlet chamber, where any fine sedimentary particles are removed. The filtered water is then fed to the base of the installation where it aerates with the stored water. When the collected rainwater has reached a minimum level, the control system can be activated, allowing the submersible pump to supply water on demand.

Control units are all supplied pre-wired, requiring only a final connection to be made to a 240V power supply via a RCD breaker. Once installed, the microprocessor based controls can be easily set up to control the pump discharge pressure and monitor the water level.

Two versions of the rainwater harvesting system are available:

- A remote connection facility suitable for an outside tap.
- A domestic backup system which can be connected via a storage tank to provide a supplementary water supply for non potable applications.
