## 1 INTRODUCTION

Acoustic Logic Consultancy (UK) Ltd (ALC) has been commissioned by the Consumers' Association to carry out a noise survey suitable for planning submission to the London Borough of Camden, recording existing noise levels around the 2 Marylebone Road & 1-9 Albany Street property (the Which? Headquarters), in order to make recommendations on façade treatment to mitigate noise ingress and specify limiting levels for noise emitting equipment for the building (such as air discharge/intake at louvres and plant).

## 2 SITE DESCRIPTION AND MEASUREMENT LOCATIONS

The following figure presents the site location and monitoring positions.

The site is bounded by Marylebone Road (A501) to the south, Albany Street (A4201) to the east and Peto Place to the west and north. The surrounding area is mixed use, consisting of offices and residential units, hotels, bars and restaurants.

The nearest sensitive receptors include neighbouring residential and office units.

Figure 1 – Site Map

## 3 SURVEY METHODOLOGY

Noise measurements were undertaken in accordance with BS 7445-2:1991<sup>1</sup>. This document defines parameters, procedures and instrumentation for noise measurement and analysis.

Noise measurements were undertaken using a Nor140 Type 1 sound level meter and a Norsonic Type 1 field calibrator (114.0 dB @ 1kHz). The sound level meter was calibrated before and after measurements and no significant calibration drift was detected (up to +0.2dB).

Table 1 – Survey Equipment

| TYPE              | MANUFACTURER | MODEL   | SERIAL NUMBER | CALIBRATION DUE DATE |
|-------------------|--------------|---------|---------------|----------------------|
| Sound Level Meter | Norsonic     | Nor 140 | 1403728       | 09/2013              |
| Calibrator        | Norsonic     | Nor1251 | 32492         | 09/2013              |

Noise measurements consisted of ambient ( $L_{Aeq}$ ), background ( $L_{A90}$ ) parameters. Measurements took place during daytime and night-time periods on the 24<sup>th</sup> January 2013. Daytime measurements consisted of 15-minute periods and night-time measurements consisted of 5-minute periods.

Short term attended noise measurements were conducted at ground level at positions 1-4 and at rooftop level at positions 5-6. The microphone was positioned at a height of 1.2m from local ground/rooftop level.

## 4 BASELINE SURVEY RESULTS

The noise environment at the site was dominated by road traffic along Marylebone Road (A501) and Albany Street (A4201).

During the site visits no noticeable levels of ambient vibration were encountered by the attending acoustic consultant.

Weather conditions for the duration of the survey were generally calm, with no heavy winds or precipitation.

The following table presents a summary of the noise survey results. The full set of results is presented in Appendix A.

**Table 2 –Survey Results (Free-Field Values)**

| POSITION | AVERAGE AMBIENT NOISE LEVEL<br>dB $L_{Aeq}$ |                               | LOWEST BACKGROUND NOISE LEVEL<br>dB $L_{A90}$ |                               |
|----------|---|-------------------------------|---|-------------------------------|
|          | Daytime<br>0700-2300 Hours                  | Night-time<br>2300-0700 Hours | Daytime<br>0700-2300 Hours                    | Night-time<br>2300-0700 Hours |
| 1        | 72  | 71                            | 65  | 61                            |
| 2        | 60  | 60                            | 56  | 55                            |
| 3        | 60  | 59                            | 53  | 50                            |
| 4        | 70  | 69                            | 61  | 59                            |
| 5        | 58  | 56                            | 56  | 52                            |
| 6        | 67  | 56                            | 67  | 52                            |

## 5 FAÇADE ACOUSTIC PERFORMANCE

BS 8233:1999<sup>2</sup> provides indicative design range ambient noise levels in spaces dependant on their usage. These noise levels are details in Table 5 and 6 of BS 8233, and are summarised in the following table as per the proposed development uses.

**Table 3 –BS 8233 Indoor Ambient Noise levels**

| CRITERIA   | TYPICAL SITUATIONS                            | DESIGN RANGE dB $L_{Aeq,T}$ |
|--|---|-----------------------------|
| Reasonable conditions for study and work requiring concentration | Private office, Meeting room, Security office | 35-40                       |
| Reasonable acoustic privacy in shared spaces                     | Reception area                                | 35-40                       |
|  | Open plan office, Internal Public Zone        | 45-50                       |
| Reasonable speech or telephone communications                    | Kitchen                                       | 50-55                       |

In typical façades, windows are usually the weakest form of sound insulation; the remainder of the building envelope would typically provide a Weighted Sound Reduction Index ( $R_w$ ) of up to  $R_w$  50 dB. It is understood that mechanical ventilation is used in the building.

ALC has provided the following recommendations for acoustic performance for glazing in order to achieve the BS 8233 indoor noise level design ranges:

East façade (facing Albany Street)

- Private offices, Meeting rooms –  $R_w$  35 dB, e.g. 10mm single glazing or thermal insulating units (10-12-6)
- Open plan office, Internal public zone (4<sup>th</sup> floor) –  $R_w$  31 dB, e.g. 4mm single glazing or thermal insulating units (6-12-6)

South façade (facing Marylebone Road)

- Private offices, Meeting rooms, Security office (ground floor), Reception area (ground floor) –  $R_w$  35 dB, e.g. 10mm single glazing or thermal insulating units (10-12-6)
- Open plan office –  $R_w$  31 dB, e.g. 4mm single glazing or thermal insulating units (6-12-6)

West façade (facing Peto Place)

- Meeting rooms, Open plan office, Kitchen –  $R_w$  31 dB, e.g. 4mm single glazing or thermal insulating units (6-12-6)

The following tables present typical acoustic performance for the 4mm and 10mm single glazing option examples.

**Table 4 – Example Glazing Performance**

| EXAMPLE GLAZING UNIT               | WEIGHTED SOUND REDUCTION INDEX | SOUND REDUCTION INDEX AT EACH OCTAVE BAND CENTRE FREQUENCY (Hz) |     |     |    |    |
|------------------------------------|--------------------------------|---|-----|-----|----|----|
|                                    |                                | 125   | 250 | 500 | 1k | 2k |
| 4mm single glazing                 | $R_w$ 31 dB                    | 20  | 22  | 28  | 32 | 33 |
| Thermal insulating units (6-12-6)  | $R_w$ 31 dB                    | 20  | 19  | 29  | 38 | 34 |
| 10mm single glazing                | $R_w$ 35 dB                    | 26  | 27  | 34  | 35 | 36 |
| Thermal insulating units (10-12-6) | $R_w$ 37 dB                    | 26  | 27  | 34  | 40 | 38 |

## 6 OPERATIONAL NOISE LIMITS

The London Borough of Camden Replacement Unitary Development Plan (Table E, Appendix 1) states the following operational limits for noise levels from plant and machinery.

| Noise description and location of measurement   | Period                 | Time      | Noise level   |
|---|------------------------|-----------|---------------|
| Noise at 1 metre external to a sensitive façade   | Day, evening and night | 0000-2400 | 5dB(A) <LA90  |
| Noise that has a distinguishable discrete continuous note (whine, hiss, screech, hum) at 1 metre external to a sensitive facade | Day, evening and night | 0000-2400 | 10dB(A) <LA90 |
| Noise that has distinct impulses (bangs, clicks, clatters, thumps) at 1 metre external to a sensitive façade                    | Day, evening and night | 0000-2400 | 10dB(A) <LA90 |
| Noise at 1 metre external to sensitive façade where LA90 >60dB  | Day, evening and night | 0000-2400 | 55dB LAeq     |

The following table presents recommended operational noise limits for building plant associated with the proposed development.

**Table 5 – Building Services Plant Operational Noise Limits (at 1m External to a Sensitive Façade)**

| PERIOD               | LOWEST MEASURED BACKGROUND LEVEL | OPERATIONAL LIMIT (NON-TONAL / NON-IMPULSIVE) | OPERATIONAL LIMIT (TONAL / IMPULSIVE) |
|----------------------|----------------------------------|---|---------------------------------------|
|                      | dB LA90                          | dB LAeq                                       | dB LAeq                               |
| Daytime 0700-2300    | 53                               | 48  | 43                                    |
| Night-time 2300-0700 | 50                               | 45  | 40                                    |

To meet these operational noise limits it is recommended that rooftop plant be limited to a sound power level of 80 dB L<sub>w</sub> (assuming noise emission is non-tonal).

## 7 CONCLUSION

ALC has been commissioned by Consumers' Association to carry out a noise survey suitable for planning submission to the London Borough of Camden, recording existing noise levels around the 2 Marylebone Road & 1-9 Albany Street property (the Which? Headquarters), in order to make recommendations on façade treatment to mitigate noise ingress and specify limiting levels for noise emitting equipment for the building (such as air discharge/intake at louvres and plant).

Noise measurements consisted of ambient (L<sub>Aeq</sub>), background (L<sub>A90</sub>) parameters. Measurements took place during daytime and night-time periods on the 24<sup>th</sup> January 2013.

The noise environment at the site was dominated road traffic along Marylebone Road (A501) and Albany Street (A4201).

During site visits no noticeable levels of ambient vibration were encountered by the attending acoustic consultant.

ALC has provided the following recommendations for acoustic performance for glazing in order to achieve the BS 8233 indoor noise level design ranges:

East façade (facing Albany Street)

- Private offices, Meeting rooms – R<sub>w</sub> 35 dB, e.g. 10mm single glazing or thermal insulating units (10-12-6)
- Open plan office, Internal public zone (4<sup>th</sup> floor) – R<sub>w</sub> 31 dB, e.g. 4mm single glazing or thermal insulating units (6-12-6)

South façade (facing Marylebone Road)

- Private offices, Meeting rooms, Security office (ground floor), Reception area (ground floor) – R<sub>w</sub> 35 dB, e.g. 10mm single glazing or thermal insulating units (10-12-6)
- Open plan office – R<sub>w</sub> 31 dB, e.g. 4mm single glazing or thermal insulating units (6-12-6)

West façade (facing Peto Place)

- Meeting rooms, Open plan office, Kitchen – R<sub>w</sub> 31 dB, e.g. 4mm single glazing or thermal insulating units (6-12-6)

ALC has provided recommendations for operational noise limits and sound power levels for building plant associated with the proposed development in line with London Borough of Camden criteria.

## APPENDIX A

### DAYTIME SURVEY (FREE-FIELD VALUES)

Pre Calibration: 114dB @ 1kHz  
Post Calibration: 114.2dB @ 1kHz

| Location | Date       | Time  | Duration | L <sub>Aeq</sub> | L <sub>Amax</sub> | L <sub>A10</sub> | L <sub>A90</sub> | Comments   |
|----------|------------|-------|----------|------------------|-------------------|------------------|------------------|--|
| 5        | 24/01/2013 | 15:00 | 15mins   | 58.1             | 67.7              | 59.8             | 56.1             | No tonal elements from noise plant. Low wind speed. Overcast/grey skies                                  |
| 6        | 24/01/2013 | 15:16 | 15mins   | 67.3             | 70.4              | 67.8             | 66.8             | No tonal elements from Kitchen extract.  |
| 1        | 24/01/2013 | 15:45 | 15mins   | 70.8             | 88.9              | 73.6             | 64.5             | Traffic: stationary traffic & flowing traffic, engines running, several buses waiting at traffic lights  |
| 2        | 24/01/2013 | 16:05 | 15mins   | 60.0             | 70.9              | 62.3             | 55.9             | Side of building. Cobbled path. Few people walking by.   |
| 3        | 24/01/2013 | 16:24 | 15mins   | 60.4             | 73.8              | 64.7             | 52.7             | Back of car park entrance. Few people walking by.  |
| 4        | 24/01/2013 | 16:44 | 15mins   | 70.8             | 84.3              | 74.5             | 62.2             | Side façade. Moving traffic. Lots of buses passing by but not stopping. Cars stopping at zebra crossings |
| 1        | 24/01/2013 | 17:02 | 15mins   | 72.0             | 90.2              | 74.2             | 65.7             | Traffic: stationary traffic & flowing traffic, engines running, several buses waiting at traffic lights  |
| 4        | 24/01/2013 | 17:21 | 15mins   | 69.8             | 81.4              | 73.6             | 61.1             | Side façade. Moving traffic. Lots of buses passing by but not stopping. Cars stopping at zebra crossings |
| 1        | 24/01/2013 | 17:40 | 15mins   | 72.6             | 95.1              | 74.0             | 65.9             | Traffic: predominantly stationary traffic. Several buses waiting at traffic lights.                      |
| 4        | 24/01/2013 | 17:59 | 15mins   | 70.5             | 84.0              | 73.7             | 62.7             | Side façade. Moving traffic. Lots of buses passing by but not stopping. Cars stopping at zebra crossings |
