Description and Sources

Description

An excavation and watching brief was carried out at Rosemary School and Sensory Gardens by AOC Archaeology Group in 2007-2008. The archaeological programme consisted of evaluation by trenching, a watching brief during the general ground reduction, an excavation and a watching brief during the excavation of the foundations for the new development. Five phases of occupation during the post-medieval period were identified and the main period of occupation appeared to be between the 18th and 19th centuries. Earlier 17th century cut features were probably associated with gravel extraction activities at the site. Finds included pottery sherds, glass, clay tobacco pipes, building material and animal bone.

Natural deposits of sand and gravel were found at an average depth of 17m OD

Description and Sources

Description

A building survey was carried out at the College for the Distributive Trades by Museum of London Archaeology in 2009. The oldest part of the building was constructed in 1872-74 and opened as a school known as Eagle Court Board School or St John's Lane School. The building was extended northwards in 1893-94 but stopped being used as a school in 1918. It later became a technical and further education college but was last used in the 1990s.

Description and Sources

Description

An archaeological excavation was carried out at St Bartholomew's Hospital by Museum of London Archaeology in 2007. The excavation found two phases of the Roman city ditch although there was no evidence of Roman activity at the site after AD 200. Three phases of the medieval city ditch were also found. The second phase had a backfill dated to 1080-1140. Finds included an assemblage of cat bones, a fragment of Westminster tile and a cess pit containing domestic and industrial pottery dating to 1140-1170.

Natural gravel was found at 11.82m OD

Description and Sources

Description

An archaeological watching brief on geotechnical test pits took place at 5-7 Giltspur Street by Museum of London Archaeology in 2008. Late medieval or post-medieval fills were found in four of the eight trial pits. The work took place at numbers 5 and 6 Giltspur Street but the report recommends that two evaluation pits should be opened at number 7.

Natural deposits of sand and gravel were found between 13.07m OD and 12.07m OD

Description and Sources

Description

A geophysical survey was carried out at Lincoln's Inn and Lincoln's Inn Fields by GSB Prospection in 2008. Four areas within Lincoln's Inn Fields, The North Garden the Courtyard and the Herb Garden were surveyed using magnetic, resistance and ground penetrating radar surveys. The remains of World War II underground air raid shelters were detected in Lincoln's Inn Fields while potential former garden features such as a possible circular water feature were detected in the North Garden. Anomalies were detected in both the Courtyard and Herb Garden.

Description and Sources

Description

An evaluation was carried out at Lincoln's Inn and Lincoln's Inn Fields by Time Team, Wessex Archaeology and the Museum of London Archaeology in 2008. Post excavation assessment was undertaken by Wessex Archaeology. Some structural remains of buildings which could be medieval in date were found and a World War II bunker was excavated in Lincoln's Inn Fields. Finds included late prehistoric and Romano-British pottery and two silver medieval coins, one of which dated to the reign of Elizabeth I.

Natural deposits were not observed

Description and Sources

Description

A watching brief was carried out at Crown House by Museum of London Archaeology in 2008. Crown House was originally built in 1919-1921 but had recently been demolished. The basement slab of the building covered made ground, brick, concrete and steel structural elements of the building. No archaeological deposits were observed.

Natural deposits of sand, gravel and clay were observed between 14.00m OD and 13.69m OD

Description and Sources

Description

An evaluation was carried out at Hugh Myddelton School by Museum of London Archaeology in 2009. A number of clay tobacco pipes dating to between 1610 and 1640 were found. The brick wall of a soakaway was also uncovered which contained clay pipes dating to between 1680 and 1740. A brick lined cess pit that was backfilled between 1820 and 1830 was also found and contained a number of items such as pottery sherds, clay pipes, glass vessels and a pewter tankard.

Natural brickearth was found at 22.03m OD

Description and Sources

Description

An evaluation was carried out at Serjeants' Inn by Pre-Construct Archaeology in 2008. Seven test pits were monitored: three in the basement, two in the courtyard to the west of the eastern wing and two at the exit from Serjeant's Lane to Lombard Lane. A truncated medieval pit was found in the courtyard, which contained large quantities of pottery and fish bones dating to between 1230 and 1350. Another pit was found in one of the exit test pits and could be dated to between 1340 and 1350. A wall and a well dating from the post medieval period were found in the other exit test pit.

Natural deposits of brickearth, sand and gravel were observed between 9.79m OD and 10.33m OD

Description and Sources

Description

An evaluation was carried out at St Bartholomew's Hospital by Museum of London Archaeology in 2009. It was hoped that further traces of the Roman and Medieval City ditches that had been recorded during an earlier evaluation would be found. While this evaluation found a cut feature of indeterminate date it is not thought to be part of the City Ditch.

Natural deposits of orange gravel and dark brown sand were observed between 12.10m OD and 12.60m OD

Description and Sources

Description

A desk top assessment of Serjeant's Inn was carried out by Pre-Construct Archaeology in 2008. The archaeological potential for Prehistoric features and artefacts is low while the potential for finds from the Roman, Saxon, Medieval and Post Medieval periods is considered high. However, it is thought that archaeological survival will be best in areas of the site that have not been truncated.

Description and Sources

Description

A desk based assessment of the Kenton & Lucas Building at St Bartholomew's Hospital was carried out by RPS Planning in 2008. The assessment was carried out in advance of a development that would replace the existing basement slab with a thicker slab to support the weight of new equipment. It is thought that the construction of the current basement and other groundworks have led to the loss of archaeological remains.

Description and Sources

Description

A watching brief was carried out at the Royal Courts of Justice by Canterbury Archaeological Trust in 2010. A brick foundation which dated to the late 17th or 18th century was uncovered in one of the trenches. The survival of this structure to just below ground level suggests that archaeological deposits and structures survive away from the limits of the main Victorian buildings.

Natural deposits were not observed.

Description and Sources

Description

Watching brief undertaken by Angus Stephenson for CgMs, August 2000; no site code. The field work consisted of observation of piling rig uprisings in the basement of a proposed new development. No evidence of human activity was identified below the concrete floor of the 20th century building. No further periods recorded on site.

Description and Sources

Description

A watching brief was carried out at Chichester House by Museum of London Archaeology in 2008. A Post Medieval cess pit fill was the only archaeological feature recorded during the watching brief. The lack of other archaeological deposits suggests that they were all removed during the construction of Chichester House during the 1950s.

Natural deposits of sandy gravel were observed at 18.80m OD.

Wakefield Street, Bloomsbury, London, WC1N

Description and Sources

Description

A desk based assessment of Wakefield Street was carried out by Museum of London Archaeology in 2010. There is a low potential for archaeological remains dating to earlier than the 19th century. However, an early 19th century Baptist chapel formerly occupied the site and there is a high likelihood that its buried footings would be found and removed by any subsequent development.

7 Wakefield Street, Bloomsbury, London, WC1

Description and Sources

Description

A desk based assessment of 7 Wakefield Street was carried out by Pre-Construct Archaeology in 2010. The site is considered to have a high potential for archaeological remains from the Post Medieval period but a low potential for any earlier periods. The site was not developed until the late 18th century and was initially used for brick and clay extraction although there is a slight possibility that human remains might be found because of the site's proximity to St George's burial grounds.

Description and Sources

Description

A watching brief was carried out at Ludgate Hill by Compass Archaeology between 2008 and 2009. The watching brief found Roman stratigraphy relatively close to the current ground level and a number of Roman pottery fragments that could be dated to between AD 90 to 120 were recovered. A truncated Medieval chalk wall base and a 17th century brick cellar wall were also found.

Natural deposits of sandy gravel were observed at 11.95m OD.

Description and Sources

Description

An evaluation was carried out at 13-15 Eagle Court by Museum of London Archaeology in 2009. The evaluation found a number of Medieval dump deposits and a cut feature dating from the second half of the 14th century when the site was part of St John's Priory. The remains of at least four Post Medieval properties dating from the 18th century onwards were also identified and consisted of brick walls, floors and a number of other internal and external features including fireplaces.

Natural deposits of sand and gravel were observed between 13.68m OD and 14.02m OD.

49-50 St John's Square, London, EC1

Description and Sources

Description

A desk based assessment of 49-50 St John's Square was carried out by Museum of London Archaeology in 2010. A previous excavation that took place when the basement floor was lowered found remains associated with the undercroft of the Great Hall of the Priory of St John of Jerusalem. Due to the truncation caused by the construction of the present basement the potential for any surviving archaeological remains is low and probably limited to fragmentary remains of deep cut features dating to the Medieval and Post Medieval periods.

Description and Sources

Description

A ground probing radar survey was carried out at St Bartholomew's Hospital by Stratascan in 2008. A number of anomalies, which may be of archaeological origin, were identified. Inclined events provide weak evidence for a ditch feature, but these may be caused by geological formations. Discrete anomalies may point to the presence of buried structural debris.

Description and Sources

Description

An Archaeological Excavation was carried out by MoLAS between 28/01/99 and 09/03/99 at Black Friars Court, formerly Evangelist House. This was funded by St. George North London Ltd and Development Securities Ltd. A Roman well was found, which went out of use in AD120, however the majority of the site was Medieval and Post Medieval. In 1159 the site belonged to the Knight Templar as part of a plot on the east bank of the River Fleet. In 1309 the Dominican Friary at Blackfriars acquired the site and at this time extended the City Wall north- south along the east bank of the fleet. This construction programme had a major impact on the site, which was quarried on an unprecedented scale: one massive quarry pit extended across the whole east- west width of the site (c. 40m) and up to 21m north- south. The site was quickly consolidated, and became part of the Dominican's garden ground from 1309- 1538: the quarry cuts backfills were broadly dated to 1080-1350 by pottery. Features dating from the life of the Friary within the garden were recorded, including a kitchen waste pit containing finds of pottery and bone. A chalk- lined cesspit with backfill dated 1080-1350 was also found. After the Dissolution of the Friary, the site passed into private hands and was developed. A brick- lined well in use 1650-1700, a brick-lined cesspit and a second rectangular brick-lined cesspit were on the site pre- 1666 Great Fire. Post- 1666 features included five cesspits. The natural is London Clay (4.39m OD) overlain by alluvial gravels (7.35m OD).

Description and Sources

Description

A watching brief was undertaken at Whitefriars, City of London between January and April 2002 following the extensive excavations in 2000 and 2001. Five locations were monitored, manhole 1 on Tudor Street, manhole 2 and manhole 3 on the Carmelite Street side and 4 and 5 to the south on Tallis Street. These confirmed the location of the 1396 river wall and information on its construction method. The southern face was located beneath the foundations of the vaults supporting the pavement on Tallis Street. The existence of a late medieval dock was revealed in contrary to former belief. The fragmentary wall in manhole 2 maybe connected to the building of the medieval dock or associated structures. Significant structural remains were recorded in manhole 3 including a 90 degree returned wall and a timber structure. The timber piece may well be related to the tanks of the distillery located further to the west.

Description and Sources

Description

An archaeological evaluation was undertaken by MoLAS on the site of the former Patent Office 1 Furnival Street, London EC4. this was commissioned by Sidell Gibson Partnership on behalf of their client City & General. Six geotechnical pits and seven evaluation pits were excavated on site. these revealed redeposited brickearth that probably relates to a period of quarrying possibly dating to the Roman period although there is no evidence for this. A series of post-medieval dumps and pits were exposed the majority being from the 17th century. A number of wall segments dated to the 18th century were found although over much of the area the degree of truncation was extensive. Natural was natural sand and gravel.

Description and Sources

Description

The Museum of London Archaeology Service conducted a watching brief on the site of 45 Quality Court, London EC4 in 2002. This was carried out by monitoring the digging of new lift pits, several large foundations and a network of drain runs with associated manholes. The holes were excavated by hand by the contractors under supervision by MoLAS. The new lift pit area revealed domestic refuse pits of undetermined date, the manhole area a mixture of brickearth and gravel; the foundations much the same as the manhole sequence; and the drain runs excavated to a depth of 0.80m revealed further dumps although with no dating evidence. There is the possibility that brickearth quarrying took place here from the 14th century onwards, although whether it is repeated or continuous is not known. Roman burials are thought to have been removed by this quarrying.

Natural terrace gravels were recorded at 16m OD.

Description and Sources

Description

An Archaeological Evaluation was carried out by MoLAS at 31-32 and 35-37 Cock Lane, City of London, EC1, between the 22nd July and 22nd Nov 2002. This was commissioned by United Homes and the proposed redevelopment involves the construction of a new basement level at 10.785m OD and a new lower ground floor. Three evaluation pits were excavated on the site, one within the basement of 31-32 Cock Lane and two within the shared basement of 35-37 Cock Lane. The third test pit was excavated to re-evaluate observations of a geotechnical test pit in 35 Cock Lane carried out 1991. The natural sand was overlain by make-up layers which yielded potsherds dating to the Roman period in 31-32 Cock Lane. 36-37 Cock Lane revealed 19th c. made ground above natural gravel deposits and the test pit in 35 Cock Lane revealed a fragmentary medieval chalk and mortar wall foundation. This wall sealed earlier deposits of sand and chalk, which contained disturbed human remains, possibly Roman.

Description and Sources

Description

PCA Ltd carried out an archaeological evaluation at Caroone House, 14 Farringdon Street, London EC4 in 2002. Nine trenches were excavated in and around the basement of the existing standing building. All areas were excavated by hand and recorded along with an extensive programme of sampling including bulk column and augering. Trench 1 revealed waterlain silts that may represent ditch fills or channel fills and may well be associated with the southern part of the Fleet Prison moat or eyot channel. Cutting these were a small amount of 19th century masonry and a substantial chalk and Kentish Ragstone wall. In addition the curtain wall; of chalk and Kentish Ragstone; of Fleet Prison was found although due to the lack of facing and regular built courses it is suggested it may only be a foundation. Other post-medieval walls were exposed in other trenches; one in association with a wooden beam slot. A pre-1700 brick cellar and associated floors was revealed; two culverts from the same period and a large stepped 19th century foundation of unfrogged bricks. Across the site truncation was caused by 20th century drain pipes.

Description and Sources

Description

The Museum of London Archaeology Service has carried out a number of different phases of work on the site from 1992 to 2000 and under two site codes HST92 and HSN99. This event refers to nine geotechnical test pits and two boreholes. The results of the combined fieldwork was presented in a single report. Residual Roman pottery sherds and fragments of human remains were found on site. A large east-west drainage ditch, probably running to the Fleet, was filled with domestic refuse which could be dated between 1150 and 1350. A number of later channels or sumps truncated the backfill of the ditch, dating to the middle of the fourteenth century. To the south of the ditch was a barrel well which was backfilled at the end of the fourteenth century. A possible medieval chalk wall truncated the topmost reclamation deposits over the ditch. Another chalk and brick wall dated to the late fifteenth century but most of the other post-medieval features were truncated by modern activity. Early nineteenth century brick culvert drains survived and may have been associated with a circular brick-lined well. The drains were truncated by a series of Victorian basements and modern dumps.

Description and Sources

Description

MoLAS undertook an archaeological watching brief at the site of the Former Patent Office, 1 Furnival Street, London EC4 being commissioned by Sidell Gibson on behalf of the client City and General in advance of the refurbishment of the Southampton Buildings and the Staple Inn Buildings. This took place between 21/05/02 and 20/09/02. All work was monitored by MoLAS including the lowering of basement floors, construction of new pad foundation and a tower crane base, drainage manholes and underpinning. A decorated medieval floor tile was found in a secondary context and extensive mid to late 17th century brickearth and grave quarries were recorded. These may have destroyed earlier Roman and Saxon deposits. the wall foundations of the 19th century Great Seal Patent Office were traced. Natural was brickearth at 17.50m OD with truncated gravel at 15.4m OD.

Description and Sources

Description

MoLAS undertook an archaeological evaluation on the site of 45 Quality Court, London EC4 commissioned on behalf of the client by Sidell Gibson. The work was undertaken between the 08/10/01 and 15/10/01. Five trial pits were monitored. Test pit 2 was dug to 1.2m for archaeological purposes and 3 was extended to 2.5m x 1.5m to fit in with the area of the proposed lift shaft. This revealed extensive brickearth quarries backfilled with domestic rubbish and dated by the presence of a fine Kingston-ware baluster jug to the 15th century. The same domestic rubbish was reworked in one area of the site in the 17th or 18th centuries indicated by the presence of clay tobacco pipes.

Description and Sources

Description

MoLAS undertook an archaeological monitoring of geotechnical work on the site of the Former Patent Office, (formerly 25 Southampton Buildings) 1 Furnival Street, London EC4, commissioned by Sidell Gibson on behalf of the client. three geotechnical test pits were excavated in site, A measuring 0.9m x 0.6m; B 1.4m x 0.9m and C measuring 1.1m x 0.6m. Archaeological deposits in A found a thick brown sandy clay silt with occasional inclusions of tile, animal one and oyster shell. B produced no archaeological deposits. C revealed a construction dump overlaying crushed bricks. Archaeological deposits consisted of a thin layer of dark grey/brown clay sandy silt with charcoal fleck. This shows that archaeological deposits do survive, yet the sample area is too small and therefore insignificant for interpretation.

Description and Sources

Description

An archaeological desk based assessment was carried out in 2003 by the Museum of London Archaeology Service.

The site has good potential for remains from the medieval foundation of the London Charterhouse as well as it's used after the Dissolution. Additionally there is high potential for the preservation of post medieval buildings, as well as 17th century gravel extraction pits. Potential for earlier periods of use are limited to Roman material. Field evaluation is likely to be necessary to ascertain the survival of archaeological remains on site, as an extensive series of basements are known to have been constructed, and would have had a significant impact on archaeological survival.

WATER FEATURE, NEW SQUARE GARDENS, LINCOLN'S INN, WC2

Description and Sources

Description

The layers observed consisted of post medieval garden soils and domestic rubbish dumps. Artefacts recovered indicated the earliest deposits in trench 1 were of late 18th to 19th century date and in trench 2 the earliest layer was dated to the 17th century. The domestic rubbish is thought to fill brickearth quarries and may have been reworked a number of times throughout history.

Address

Christchurch Greyfriars, Newgate Street, London, EC1

Description and Sources

Description

In August 1999, Museum of London Archaeology Service undertook the monitoring and recording of three test pits within the garden of Christchurch Greyfriars ruin. This was carried out as part of the development of the adjoining property that included the line of the pre-1973 church walls being reinstated and the ruined church and its garden (the post-medieval burial ground) being landscaped and completely repaved. Three phases of evaluation and watching brief work were carried out from August 1999 until February 2001. Today the site is a garden managed by the Corporation of London as a public open space on the intersection of King Edward Street and Newgate Street within the City of London. The work was commissioned by Ove Arup & Partners on behalf of Merrill Lynch. Work revealed no medieval remains but established that there are intact brick built vaults under two of the chest tombs and residual human bones were recovered during the watching brief. This also revealed foundations of the 19th century buildings along the Newgate Street frontage. Work inside the church, exposed two early 19th century brick built vaults. Natural was not located.

Description and Sources

Description

During the excavation of drainage works to the north and south of the chapel, the Museum of London Archaeology Service conducted a watching brief. A number of shallow drainage trenches and two soak-away pits were investigated. Human bone, medieval and post-medieval pottery, two tombstones and part of a seventeenth century brick wall were found in the drainage channels. Sixteenth century green-glazed pottery was found in the more northerly pit. One sherd of medieval pottery was found in the lowest levels of the second pit and a make-up layer of crushed tile was cut by a sixteenth century ditch, which was later sealed by levelling layers. No features or finds of earlier than medieval date were discovered.

Description and Sources

Description

Four evaluation trenches, two geotechnical test-pits were excavated by the Museum of London Archaeology Service. A red brick wall was the earliest feature in the first test-pit. This was superseded by a Victorian basement backfilled with rubble. A pit was cut into the natural brickearth in the second test-pit. This contained bone, oyster, wood and seeds and seems to be part of a post-medieval cess-pit. It was sealed by post-medieval backfill. Seventeenth century walls and Victorian drains and walls were found in all trenches. Organic material was found up against the seventeenth century walls, suggesting they formed a cess-pit. A shallow linear cut containing pottery dating from 1620-1700, cutting levelling layers associated with clay pipes dated to 1610-1650 and one sherd of Middle Saxon pottery, was found in one trench, possibly the foundation for a garden path. Foundations of eighteenth century houses overlaid this. Two boreholes were investigated by LBH Wembley Ltd. they uncovered similar evidence to the two test-pits. No features or finds earlier than Middle Saxon were encountered.

Description and Sources

Description

Three test-pits were investigated by the Museum of London Archaeology Service, who also observed an engineering test-pit and several boreholes. A post-medieval 'ploughsoil' was dated to 1480-1600. Some residual medieval roof tile was also recovered. The majority of the site was truncated by modern basements. No earlier features were encountered.

Description and Sources

Description

Three engineering test pits were excavated by SAS Ltd. The test pits were monitored by the Museum of London Archaeology Service. No archaeological deposits or features were observed. the test pits revealed between 1.5m and 2.7m depth of Victorian and modern brick rubble backfill. The area was bombed during WWII and this may be evidence that buildings on the site were damaged or destroyed.

Description and Sources

Description

An archaeological watching brief was carried out by the Museum of London Archaeology Service at 6-10 Kirby Street and 119-124 Saffron Hill, in 2001. 19th century and later remains were encountered. 19th century basements overlying associated possible fuel tanks constructed of redbrick and black Bull-nosed brick were found. The internal faces of the tank were rendered with a pitch like substance. The tank was sealed by a decayed raft of timber under the later basement slab. Later white, glazed brick tanks were observed in the north and east of the site were present beneath the slab of the former building. These were cut into the London clays. *Natural gravels and London Clay (both truncated) were recorded at heights of 12.45 m OD and 10.75 m OD.*

Description and Sources

Description

Eight geotechnical trial pits were inspected by Norton Thompson Associates. All pits were less than a metre square. No readily datable artefacts were found, only bits of brick and tile of post-medieval date. Lower contexts were generally free of artefactual material and therefore may represent garden soil. No features or finds pre-dating the post-medieval period were encountered.

Description and Sources

Description

One trench was excavated by Pre-Construct Archaeology. Post-medieval deposits consisted of seventeenth century dumped deposits, a demolition or levelling sequence and a nineteenth century wall. A possible post-medieval horticultural soil was also documented in the lower part of the sequence. Medieval deposits probably represent the remains of hillwash reworking natural subsoils combined with limited refuse disposal.

Description and Sources

Description

One trench was excavated by the Museum of London Archaeology Service. recovered from the general make-up and from a number of pits were a number of pieces of thirteenth century stonework presumably dumped during the Dissolution. Some of the stones appear to derive from at least two doors and other parts of a thirteenth century building. Another carved stone was a fragment from a polygonal oriel window dating to the reign of Henry VIII. No features earlier than medieval were encountered.

Description and Sources

Description

An archaeological desk based assessment was undertaken in 2003 by CgMs Consulting in advance of the redevelopment of this site.

The consultant concluded that the likelihood of prehistoric remains surviving is low, and the chance for Roman remains is low to moderate. The chance of Saxon evidence surviving is also low, and the potential of the site is primarily focussed on the medieval and post medieval periods, as settlement occurred from the 13th century onwards.

However, the construction of basemented buildings on the site in the 1880s and 1960s is likely to have caused truncation and destruction of the archaeological deposits and only the deepest cut features may survive.

Description and Sources

Description

Two boreholes and eight observation pits were monitored at 15-17 Furnival Street and 13 Took's Court, by the Museum of London Archaeology Service in 2001. The intention was to provide information on the level and nature of the present foundations and the extent of truncation and depth of surviving archaeology. A possible archaeological deposit was recorded along with disturbed brickearth.

Borough CITY OF LONDON

Address

31-32 COCK LANE, EC1

Description and Sources

Description

Previous development on the site had removed virtually all archaeological material. No horizontal stratigraphy was seen in the watching brief, but one human burial, presumed to be Roman in date, was seen cut into the natural ground.
