**Description and Sources**

**Description**

A desk based assessment was carried out for the South side of Plumtree Court, on the West of Farringdon Street, by the Mills Whipp Partnership during September 2007. Work was carried out to inform the redevelopment proposals for the site which include foundation work and a new lift shaft. The site is thought to have had a high archaeological potential before the construction of the current building's basements on the West of the site. If there are any surviving deposits on the East of the site, it is thought likely that these will likely be truncated.

**Description**

An archaeological watching brief was carried out in 2006 by the Museum of London Archaeology Service during ground reduction. Several archaeological features were observed during the works consisting of a possible Roman ploughed soil horizon, a pit and a posthole, a post medieval quarrying pit and a 19th century soakaway. A geoarchaeological survey was also carried out on the natural Quarternary deposits which existed below the basement slab. Archaeological deposits and features were recorded in section as ground reduction was carried out.

**Description and Sources**

**Description**

An evaluation and subsequent excavation was carried out in 2006 by the Museum of London Archaeology Service. Site code GWO05.

The excavation uncovered evidence for the walls of Charterhouse and number of garden features associated with the property. A stone-built latrine was also preserved in-situ.

After the Dissolution some of the Charterhouse buildings were used as a private residence and possibly as workshops. At the back of the properties were gardens which contained a number of bedding trenches and tree pits. These produced evidence of the status of the adjacent properties in the form of pottery sherds, decorated floor tiles, rings, animal bone and botanical assemblages.

Evidence of Industrial activities was found in the form of crucibles relating to metalworking and distillation and bone working waste.

A number of rare and interesting items including twenty-three candlesticks, sherds from 15 moneyboxes, a warming pan in redware and five fuming pots used for making perfume or warming aromatic herbs to release their aroma. Large numbers of clay tobacco pipes were found with an unusually high number of different makers' marks and symbols from the early and mid 17th century.

Norwich Street, London, EC4

**Description and Sources**

**Description**

An archaeological desk based assessment was conducted by CgMs in 2007 and revised in 2008. It covered a site on the south side of Norwich Street. The contractor considered it to have low potential for Prehistoric evidence, moderate-high for the Roman period, low for the Saxon period, moderate for the medieval period and low for the post medieval to modern periods. The contractor also considered that the site had received cumulative and severe impacts from previous events such as World War Two bombing and successive phases of cellars, foundations and services. In view of this they believed the proposed development would be unlikely to have significant archaeological impact.

---

**Description and Sources**

**Description**

An archaeological desk based assessment was carried out by the Museum of London Archaeology Service at the site of 50-62 Ludgate Hill, 26-34 Old Bailey and 1-9 Limeburner Lane, City of London. The site lies in an area of archaeological potential for Roman and medieval archaeological remains, low potential for prehistoric remains and moderate to high potential for post medieval remains. The presence of a double basement across the majority of the site is likely to have greatly limited their survival. However, there may be greater survival of remains below the north-western and central parts of the basement due to existing slab levels and the natural topography of the site. Greater potential for archaeological deposits in areas of the site beyond the extent of the basement may also be expected. Deep cut features, such as wells and deep pits may survive across the whole

**Event ID:** ELO7751      **Name:** Ludgate Hill (50-62), Old Bailey (26-34) and Limeburner Lane (1-9), London

site and deeply incised stream deposits associated with tributaries of the River fleet may also be located.

### Description

An archaeological desk based assessment was carried out by the Museum of London Archaeology Service in 1992 at Mount Pleasant post Office, Islington. The earliest known archaeological sites in the survey dated to the Medieval period, when it lay to the northwest of the nunnery of St Mary Clerkenwell, but the area was first developed in the post medieval period. A tavern was built on the site in the 17th century, later a bath house and then in the 18th century, a prison, the Middlesex House of Correction.

**Description and Sources**

**Description**

Cropmarks noted on aerial photographs taken in 1997 may show the base of a water conduit associated with the Carthusian monastery at Charterhouse, in the grounds of St Bartholomew's Medical College. A symmetrical pattern of eight sub-rectangular marks positioned around a central mark was observed. The marks and their position are suggestive of the base of a water conduit depicted on a plan of the monastery of c1430.

**Description and Sources**

**Description**

An archaeological desk based assessment was conducted in 2008 by CgMs in advance of the demolition of 20-24 Hatton Wall for the construction of a new building and the refurbishment of 26-28 Hatton Wall.

The potential impact of the development included the lowering of the basement at 20-24 to a deeper level than previous structures, as well as introduction of new services. The contractor indicated that the site had low archaeological potential for all archaeological periods due to the extent of past post depositional activity. In particular a watching brief at 18 Hatton Wall prior to the current development indicated the present of deep cellars from earlier buildings which are likely to have removed any archaeological deposits present. On this basis the contractor did not recommend any further archaeological mitigation measures.

**Description and Sources**

**Description**

MoLAS undertook an archaeological watching brief at 1-2 St John's Path, Clerkenwell, London EC1, commissioned by Hawkins Brown on behalf of Harrison Varma Limited, between 28/06/02 and 11/07/02. The site is located in the London Borough of Islington, bound to the west by buildings on Britton Street and to the south by St John's Path. Three trenches were made for the purpose of underpinning three walls at 1-2 St. John's path. The watching brief resulted in the discovery on the south-eastern edge of the site of an early post-medieval wall foundation, cut into dumped deposits of similar age (17th century). A later 19th century brick feature was also found, which appeared to be a flue to an industrial structure beyond the limits of the site.

**Description**

In 1981, during demolition work on the site of the former Evening Standard building, the edge of a large pit was discovered containing human remains. The date and number of individuals represented is unknown, but many represent a possible plaque/burial pit or part of the St. Bride's burial ground to the south. Construction work is likely to have destroyed some of the material, but significant remains may still survive particularly under the bordering Stonecutter Street.

**Description and Sources**

**Description**

An archaeological desk based assessment was conducted in 2006 by the Museum of London Archaeology Service in advance of a proposed development.

The assessment found low potential for prehistoric remains, and moderate potential for Roman remains. The contractor believed that there was low potential for the medieval period and high potential for archaeological evidence from the 16th century onwards.

The proposed development includes the deepening of existing basements, piling and new services which will impact on surviving deposits. The contractor therefore recommended archaeological evaluation and a watching brief over any geotechnical work. They also indicated that some of the buildings earmarked for demolition may require recording prior to removal.

**Description**

Work on refurbishment of the cellar at 6 Clerkenwell Close, a grade 2 listed 18th century building, was monitored by MOLAS. The work included the lowering of the floor level and uncovering historic masonry. An exposure of masonry 750mm wide and 1.7m high was examined. It was of irregular sized rough-hewn chalk and ragstone blocks, set in a yellow sandy lime mortar with reused roof tile. It is on the same line as the western wall of the gatehouse of St Mary's Nunnery Clerkenwell. The natural was gravel.

**Description and Sources**

**Description**

An archaeological evaluation was conducted in 2005 by the Museum of London Archaeology Service during the demolition phase of the existing buildings. Five trenches were excavated across the former roadway areas of the site where preservation might be best. The works revealed sporadic Roman features, including a ditch with the remains of a water pipe, medieval ditches and exceptional, large 17th century dumps of domestic rubbish. The finds assembly is primarily of local significance, but the industrial pottery and imported artefacts are of national, if not international, interest as they shed light on the development of technology and trade in the 17th century.

\*Natural at 14.20m OD at north, to around 14.60m OD at south\*

**Description and Sources**

**Description**

The third phase of an archaeological watching brief was carried out in 2007 by Pre-Construct Archaeology. The works included the monitoring of pile probing, test pits, ground reduction and an attempt to take a soil sample using an archaeological auger.

The pile probing exercise revealed modern deposits while the test pits revealed footings for the northern wall of the basement of the Rolls Building. The ground reduction area revealed modern rubble deposits and a concrete basement foundation.

As with the other three earlier archaeological investigations on the site no archaeological deposits or structures were found in any of the holes observed. The auger sampling failed to recover any archaeological or natural deposits due to extensive truncation.

**Description and Sources**

**Description**

An archaeological desk based assessment was carried out in 2008 by the Museum of London Archaeology Service in advance of the demolition of the existing buildings and construction of a new building. The contractor identified that the site has a low potential for the survival of prehistoric remains, although isolated finds may survive. The site has a moderate to high potential for the survival of Roman remains, as the site lies within the area of the western cemetery, and evidence of quarry pits and ditches may also be found. The site has a low potential for Saxon remains, and a moderate to high potential for remains from the medieval period. The site has a high potential to contain archaeological remains dated to the post medieval period. The proposed development will remove any surviving deposits in the areas of the new deeper basement, with the greatest impact to the north-west of the site. Deeper localised truncation will occur in areas of the pile caps, piles, lift pits, drains and service trenches. The contractor recommended that any geotechnical pits or boreholes be evaluated archaeologically, and that a field evaluation take place.

5-7 Giltspur Street, City of London, London, EC1

**Description and Sources**

**Description**

An archaeological desk based assessment was carried out by the Museum of London Archaeology Service in 2008 in advance of the demolition and rebuilding of No 7 Giltspur Street with a deeper basement and the refurbishment of Nos 5 and 6 Giltspur Street.

given the anticipated level of natural deposits and the depth of the existing basements, the contractor considered that all horizontal archaeological deposits on the site, as well as the majority of cut features, will already have been removed. The archaeological potential is limited to the bases of deep cut features.

There is a low to moderate potential for the survival of Roman remains: the site is located within the area of the Western Roman cemetery and numerous burials have been recorded in the immediate vicinity. However it is likely that only the bases of exceptionally deep cut burials and earlier quarry pits, rubbish pits and wells will survive.

There is a low to moderate potential for the survival of medieval and post-medieval remains, though again these would be limited to deep features. There is a low potential for both prehistoric and Saxon period remains.

As the construction of the new basement at No 7 will removed all surviving archaeological deposits the contractor recommended that any geotechnical pits of boreholes by monitored, and that an archaeological field evaluation be undertaken.

**Description and Sources**

**Description**

An archaeological desk based assessment was conducted in Pre-Construct Archaeology, initial in 2004 but updated in 2008. The current proposal envisages the retention of the majority of the building present on the site and the erection of a new extension into the present courtyard. The contractor indicated that the site had low potential for Prehistoric features and high for Roman to post medieval features, but is likely to have been truncated in the areas of deep basemen ting. The greatest impact was judged to be to the extension to the west of No 2 Serjeants' Inn where piles will be driven through the existing underground car park, and in the area of new lift pits to the north.

**Description and Sources**

**Description**

An archaeological watching brief was undertaken in 2006 by the Museum of London Archaeology Service on the excavation of geotechnical pits for the construction of a lift shaft. No significant archaeological features were recorded. The only deposits recorded were post medieval dumps consisting of 18th/19th century brick fragments, tile fragments, clay pipe stems and 20th century debris. The contractor therefore concluded that the archaeological potential of the site was low.

**Description and Sources**

**Description**

An archaeological desk based assessment was undertaken in 2008 by CgMs in advance of the proposed demolition of existing buildings and redevelopment of the site with basement car parking.

The contractor indicated that the site had the potential to contain Roman period burials from the 'western cemetery' of the Roman city, and had low potential for remains of all other periods due to its location, either within or to the immediate east, of the River Fleet.

The contractor indicated that due to the construction of local railways and the existing deep basement the majority of archaeological remains will have been removed. As construction of the new building will retain the existing basement and excavate only for piling the impact is likely to be low.

**Description and Sources**

**Description**

An archaeological evaluation was carried out in 1994 by the Museum of London Archaeology Service. A series of 26 engineers test pits and three archaeological trial pits were observed and recorded.

A series of alluvial deposits were observed between 4.0m and 2.0m OD. Medieval pottery sherds were recovered from the truncated horizons of these deposits.

The two northern trial pits also contained the remains of two large cut features, interpreted as rubbish pits. Cut into the central pit was a barrel-lined feature which appears to have been a domestic rubbish pit dating from 1550-1650.

Above this sequence is a large levelling layers, approximately 2m thick, dating to the 17th-18th century, which was overlain by the remnants of a brick built structure, probably part of a post Great Fire building.

Other indeterminate cut features and structural remains were observed in some of the engineers' pits.

**Description and Sources**

**Description**

An archaeological desk based assessment was carried out by the Museum of London Archaeology Service in 2000, in advance of the demolition of the current properties and construction of a new office block. At present the principle impact of the proposed works is centred around the insertion of the basement slab. Any archaeological deposits and features which do survive, beneath the current single basement slab, will be disturbed during this work. However this survival is likely to be limited to deep cut features such as wells. Possible archaeological deposits include Roman burials and evidence of agricultural activity. Furthermore the site is known to have been cultivated during the medieval period, and developed in the post medieval period. The contractor indicates that an evaluation may be necessary to determine the nature and survival of deposits.

### Description and Sources

### Description

An archaeological desk based assessment was undertaken by the Museum of London Archaeology Service in 2000. The report concluded that the site lay in an area of archaeological potential, predominantly for the Roman and medieval periods. The contractor noted the potential for surviving burials from the 'western' Roman cemetery, and although previous basements will have truncated the stratigraphy in the east, cut features may survive in areas where there have been no basements, and to the central and western sections. The contractor recommended monitoring during any geotechnical work.

**Description and Sources**

**Description**

An archaeological excavation took place at Ludgate West, 14 Farringdon Street between the 17th January and the 1st November 2005 by Pre-Construct Archaeology. The site comprise of a number of open area excavations undertaken over two phases. The excavation provided significant evidence for activity in the early Roman, Saxo-Norman, Medieval and post medieval periods, as well as some modern features.

\*Natural London Clay was observed in a few locations at a height of 1.02m below AOD\*

**Description and Sources**

**Description**

An archaeological evaluation was conducted by the Museum of London Archaeology Service. Site code GSU98, GSU99.

Natural gravel was cut by pits for the removal of the gravel and brickearth, which were backfilled in the late 16th century with general waste material. They were sealed by made ground, of 17th to early 19th century date, upon which brick buildings were constructed in the early 19th century and were demolished, probably in the late 19th century, when some of their demolition material was used to level the site. No evidence was found for the Pardon Churchyard or Black Death burials.

---

**Description and Sources**

**Description**

An archaeological desk based assessment was carried out in 1999 by the Museum of London Archaeology Service.

The site falls within the Outer Precinct of the London Charterhouse Carthusian Monastery, one of only nine to be founded in England and unusual for its urban setting. Part of the site also lies within the Pardon Churchyard within the fields to the north of St Bartholomew's Priory, which was set aside in 1348/9 for the burial for victims of the Black Death as the City cemeteries had become full.

The proposed development involves the construction of a multi-storey photographic studio, restaurant and office complex including a basement and lower ground floor on piled foundations.

Significant medieval activity including burials may be present on the site, which has only partially been disturbed by previous development. Prior to the medieval period it was probably open and has been built up since the 17th century, and has the potential to exhibit a long history of human activity. Its relation to the important monastic site of Charterhouse makes it a site of high archaeological potential.

The contractor therefore recommended selective on site monitoring and trial work including an evaluation and watching brief.

**Description**

Work carried out by Pre-Construct Archaeology in 1999. (No report in the GLSMR - Summary data only) Above the natural gravels, early medieval pits, a well and deposits were recorded, overlaid by further dumped deposits and a single burial, also of early medieval date. For the Tudor period a massive gravel extraction pit and a large dump of pottery was recorded; the latter consisted almost exclusively of jugs, tankards and candlesticks and may have derived from lawyers' quarters.

**Description and Sources**

**Description**

An archaeological watching brief was conducted in 2007-8 by the Museum of London Archaeology Service at 22 Chancery Lane. Work on new foundations, underpinning of a listed wall and ground reduction was monitored in 2007-2008. Archaeological remains of the 17th century Symonds Inn and remodelling was recorded in two areas that had survived to ground level, although the rest of the site had been truncated by a basement. The Inn's remains consisted of a series of brick wall foundations, a cellar to successive structures and a mass foundation of re-used chalk, limestone and mortar. The remains were photographed and the surface exposures were surveyed as a 3D topographic survey, best-fitted on the ordnance survey map data. The highest archaeological remains were recorded at 17m OD.

\*Natural observed at 16m OD\*.

**Description and Sources**

**Description**

An archaeological watching brief was carried out by MoLAS at the tunnel access shaft at the junction of Blackhill and Ray Street, London EC1, between 01/12/99 and 25/02/00. This was funded by London Electricity and it comprised of observations of two access shafts and boreholes between this one at Farringdon Road, London EC1 and the one at Farringdon Street, EC4. Boreholes were logged and access shafts recorded. Post- Medieval activity was recorded in the form of 17th- 18th century landfill dumps. The natural is brickearth/ gravel (6m OD).

Myddleton Street, London, EC1

**Description and Sources**

**Description**

An archaeological evaluation was carried out at the site of Hugh Myddleton School by Museum of London Archaeology in 2009. The evaluation consisted of one trench. Natural brickearth was cut by a square pit of unknown function. A post medieval dump or levelling layer lay over the brickearth, containing clay pipes dated to 1610-1640. The dump layer was cut by a post medieval wall and post pad. The remains of another brick wall, part of a cess pit or soakway, were found in the northwest corner of the trench. A circular brick-lined cess pit containing material dated to the 18th and 19th centuries was found in the centre of the trench. The entire trench was truncated from above by 20th century buildings.

\* Natural brickearth was observed at levels between 21.94m and 22.31m OD. \*
