### 1.0 Executive Summary

To meet the requirements of the London Borough of Camden planning policies relating to energy and sustainability and to meet the requirements of the Building Regulation Approved Document Part L1A 2010 the following measures are proposed:

- Enhanced building fabric performance U-values and air tightness
- Enhanced buildings services performance high efficiency equipment and low energy lighting
- Use of air source heat pumps and underfloor heating

Use of micro-CHP has been shown not to be effective on this development.

The proposed measures result in the following outcomes:

- A minimum of 25% CO2 reduction compared to a Part L 2010 compliant dwelling
- More than 20% CO2 reduction due to the use of ASHPs when compared to the same building being heated by direct electric heating and when taking into account regulated and unregulated energy uses.
- Dwellings that can work with natural ventilation and maintain occupant comfort
- Code for Sustainable Homes (CSH) Level 3 compliance with a minimum of 50% of the energy credits achievable

In addition to the energy credits it is proposed that approximately 65% of the CSH Water credits are achievable, 50% of the Materials credits and 75% of the Waste credits. The full CSH pre-assessment is appended to this document. The pre-assessment demonstrates one possible route to achieving CSH Level 3 and a minimum of 50% of credits in the Energy, Water, Materials and Waste sections.

### 2.0 Introduction

This report has been prepared to provide a summary of the energy efficiency measures for the proposed 6 Nutley Terrace development. It is intended to address the London Borough of Camden's policies relating to climate change and sustainable design and construction, specifically CS 13 – Tackling Climate Change through Promoting Higher Environmental Standards and DP22 – Promoting Sustainable Design and Construction. It is also written with the requirements of the Camden Supplementary Planning Guidance document in mind.

### 3.0 Summary of Key Points from Camden Sustainability Supplementary Planning Guidance

The list below gives the headline requirements of the Camden sustainability planning guidance relating to energy:

- Follow the "be lean, be clean, be green" approach
- Account for regulated and unregulated energy using modelled or benchmark data for minor developments
- Demonstrate via modelling that overheating is not an issue
- Demonstrate that natural ventilation has been considered in the design
- Connect to existing district heating networks or provide CHP onsite
- Aim to achieve a 20% CO2 reduction from renewables
- Aim to achieve 50% of energy credits under the Code for Sustainable Homes

### 4.0 Summary of Key Points from Part L1A 2010

Part L1A 2010 gives five criteria by which a development must provide evidence of compliance (refer to table below). Note that Criteria 4 and 5 will be evidenced at the construction/completion stage. This report addresses steps taken to improve the design in order to meet Criterion 1, 2 and 3.

CRITERION 1:	"The calculated rate of CO <sub>2</sub> emissions from the dwelling (the Dwelling Emission Rate, DER) must not be greater than the Target Emission Rate, TER)"
CRITERION 2:	"The performance of the building fabric and the fixed building services [heating, hot water and fixed lighting systems] should achieve reasonable overall standards of energy efficiency"
CRITERION 3:	"The dwelling has appropriate passive control measures to limit the effect of solar gains on indoor temperatures in summer, regardless of whether or not the dwelling has mechanical cooling."
CRITERION 4:	"The performance of the dwelling, as built, is consistent with the DER"
CRITERION 5:	"The necessary provisions for energy efficient operation of the dwelling should be put in place."

### 4.1 Achievement of Compliance

Some additional information on how to meet each criterion is provided below:

### Criterion 1

To pass Criterion 1, the Dwelling Emission Rate (DER) must be less than the Target Emissions Rate (TER), i.e. DER<TER.

The development aims to demonstrate a good level of energy efficiency that will reduce carbon emissions due to heating, hot water generation, lighting, fans and pumps.

### Criterion 2

To pass Criterion 2 the minimum performance standards set out in the Approved Documents and supporting documentation must be met or exceeded. These are set out in Sections 4.2 and 4.3.

### Criterion 3

To pass Criterion 3, the dwelling must have less than a "High" risk of high internal temperatures. The table below shows the range of possible outcomes ranging from "Not Significant" to "High".

T <sub>threshold</sub>	Likelihood of high internal temperature in hot weather
<20.5°C	Not significant
<u>&lt;</u> 20.5°C and <22°C	Slight
<u>&lt;</u> 22.0°C and <22°C	Medium
<u>≥</u> 23.5°C	High

### 4.2 Fabric Performance

The limiting standards from the approved documents relating to building fabric are shown in the table below:

	Approved Document L1A 2010 Table 2	Approved Document C 2004
Element	Maximum area-weighted average U-value (W/m <sup>2</sup> .K)	Absolute Maximum U- value (W/m <sup>2</sup> .K)
Roof	0.20	0.35
Wall	0.30	0.7
Ground Floor	0.25	0.7
Party Wall	0.2	No limit
Windows, roof windows, glazed rooflights, curtain walling and pedestrian doors	2.0	No limit

### Energy Efficiency Statement & Code for Sustainable Homes Pre-assessment

Other limiting standards are:

- 1. Air permeability shall be <10  $m^3/hr.m^2$  @ 50Pa
- 2. Thermal bridging "the building fabric should be constructed such that there are no reasonably avoidable thermal bridges".

### 4.3 Fixed Building Services Performance

The limiting standards from the approved documents and supporting documents relating to building services are shown below:

Plant Item	Criteria
Air Source Heat Pumps (space heating)	COP > 2.2
Air Source Heat Pumps (DHW)	COP > 2.0
Air Source Heat Pumps	Seasonal Performance Factor > 2.7
Air Source Heat Pumps (cooling)	EER > 2.4
Ventilation unit (MVHR) Specific Fan Power	<1.5W/l/s
MVHR heat recovery efficiency	>70%

Minimum efficiency standards also apply to domestic lighting installations.

For fixed internal lighting these are:

- 1. At least 75% of frequently used light fittings shall be low energy type.
- 2. Low energy lights shall have an efficacy >45 lumens per circuit Watt

For fixed external lighting these are:

- 1. External lighting with automatic presence and daylight control shall have a lamp capacity of <100 Watts
- 2. External lighting with automatic presence and manual control shall have an efficacy >45 lumens per circuit Watt

### Proposed Measures to meet Camden Sustainability Policies and Part L1A 2010 5.0

The following section summarises the proposed energy efficiency strategy.

### 5.1 Software Modelling

A sample SAP assessment (using NHER software Plan Assessor Version v5.2) has been carried out on the proposed development. The results are contained within the Appendices.

### 5.2 Fabric Performance

To reduce energy demand by passive means (be lean) the building fabric performance will significantly exceed the requirements of Part L1A 2010.

The values in the table below are those currently proposed.

Element	U-value (W/m <sup>2</sup> .K)
Roof	0.13
External Wall	0.18
Ground Floor	0.18
Party Wall	N/A
Windows and glazed rooflights	1.5

Air permeability target construction value of shall be  $< 3.5 \text{ m}^3/\text{hr.m}^2$  @ 50Pa to achieve a maximum of 5 m<sup>3</sup>/hr.m<sup>2</sup> @ 50Pa.

It is assumed that quality assured accredited construction details to limit the effects of thermal bridging will not be employed. Refer to "Limiting thermal bridging and air leakage: robust construction details for dwellings and similar buildings", TSO, 2001 for such details. The default thermal bridge y-value of 0.15 is therefore assumed.

All windows are assumed to be fully openable and provide (as a minimum) single sided ventilation to assist in reducing summertime temperatures. Glazing areas are limited to reduce overheating risk and to reduce heat loss.

A medium [thermal] weight structure is assumed.

### **Fixed Building Services Performance** 5.3

To further reduce energy demand by active means (be lean) the building services performance will significantly exceed the requirements of Part L1A 2010.

The following plant criteria are proposed:

Plant Item	Proposed Design
Air Source Heat Pumps (space heating)	COP > 2.8
Air Source Heat Pumps (DHW)	COP > 2.2
Air Source Heat Pumps	Seasonal Performance Factor > 3.0
Air Source Heat Pumps (cooling)	EER > 2.8
Ventilation unit (MVHR) Specific Fan Power	< 0.7W/l/s
MVHR heat recovery efficiency	>85%

In addition, the MVHR unit will be SAP Appendix Q registered

Lighting is assumed to meet the minimum standards.

### 5.4 Air Source Heat Pumps (be green)

Air source heat pumps are proposed as an appropriate renewable technology for this development. The ASHPs will be linked to an underfloor heating system which shall run at low temperature appropriate for use with ASHPs. This is an efficient means of providing space heating and provides a comfortable living environment by the use of a radiant heating source.

A comparison with gas fired boilers using the SAP assessment software was undertaken and ASHPs were shown to be considerably more efficient - even when providing water at high temperatures for domestic hot water use.

### 5.5 Headline Camden Policies

The sections above outline the proposed "be lean, be clean, be green" approach.

As this is a minor development a full energy assessment listing out baseline energy demand, reductions due to each technology and a full estimation of unregulated emissions has not been undertaken.

Overheating is addressed under Part L Criterion 3 below.

The main living areas of House 6B will be provided with comfort cooling due to market expectation. However, occupants will always have the choice of using natural ventilation as an alternative. Designing an appropriate, low energy cooling system into the scheme at an early stage will avoid occupants retrofitting inefficient systems at a later date. As can be seen in the SAP worksheet results, CO2 emissions due to cooling are negligible.

There are no district networks in the local area which can be feasibly connected to and the site is not appropriate for a Strategic Site to support large scale CHP units to feed a wider district network.

An assessment has been made of micro-CHP units. However, the CO2 reduction benefit of installing these units is very limited. This is due to the mismatch between the high thermal output from the micro-CHP units and the low heat load of each house which leads to the units operating inefficiently. CHP is therefore not appropriate for this development.

The use of ASHPs will contribute to a significant reduction in CO2 emissions – exceeding 20% when taking into account regulated and unregulated energy. This figure has been estimated from the SAP software by establishing the difference in CO2 emissions between a direct electric system and the ASHP system.

The proposed measures results in a DER approximately 35% lower than the TER (see Appendices).

### 6.0 Part L1A 2010 Results

See the Appendices for the building regulations compliance reports.

### 6.1 Criterion 1

The area weighted TER is 14.46 kgCO<sub>2</sub>/m<sup>2</sup>/yr The area weighted DER is 23.13 kgCO<sub>2</sub>/m<sup>2</sup>/yr

The building is therefore in compliance with the requirements for Part L1A criterion 1.

6.2 Criterion 2

All of the fabric and building services performance standards are shown in the previous sections to be met or exceeded.

The building is therefore in compliance with the requirements for Part L1A criterion 2.

6.3 Criterion 3

The house assessed has an overheating risk of "Not Significant". Therefore the building is compliance with the requirements for Part L1A criterion 3. This also satisfies the Camden policy on preventing overheating and demonstrates that the building can be comfortably occupied without the need for comfort cooling.

Feb2012/CP/CD/079457

Energy Efficiency Statement & Code for Sustainable Homes Pre-assessment

Appendix A – Part L1A Building Regulations Compliance Report & SAP Worksheet

This design draft submission provides evidence towards compliance with Part L of the Building Regulations, in accordance with Appendix A of AD L1A. It has been carried out using Approved SAP software. It has been prepared from plans and specifications and may not reflect the 'as built' property. This report covers only items included within the SAP and is not a complete report of regulations compliance.

### 6. Solar gains

Solar gains are calculated using solar flux from Table 6a and associated equations to convert to the applicable orientation.

Rows (74) to (82) are used 12 times, one for each month, repeating as needed if there is more than one window type.

Details for month of January and annual totals are shown below:

	А	ccess facto Table 6d	r	Area m²	So	lar flux W/	m² g	Specific dat or Table 6b	a F	F Specific da or Table 6c	ita	Gains (W)

Issue		Credits	Level	Assumptions Made	Evidence Required
Was 2 Construction Site Waste Management	A credit is awarded where a compliant SWMP is provided with targets and procedures to minimise construction waste. Credits are available where the SWMP include procedures and commitments for diverting either 50% or 85% of waste generated from landfill. SWMP details Does the SWMP include: + No SWMP + SWMP with targets and procedures to minimise waste? + SWMP with procedures to divert 50% of waste + SWMP with procedures to divert 85% of waste	1 of 3 Credits			
Was 3 Composting	A credit is awarded where individual home composting facilities are provided, or where a community/ communal composting service, either run by the Local Authority or overseen by a management plan is in operation. Select the facilities available No composting facilities Individual composting facilities OR Communal/ community composting*? Local Authority OR Private with management plan * including if an automated waste collection system is in place	1 of 1 Credit	-		

CATEGORY 6 POLLUTION	Overall Level: 3	Overall Score	60.15		Evidence Required
% of Section Credits Predicted: 25.00%		Credits	Level	Assumptions Made	(The below cells can be formatted by assessors if
Contribution to Overall Score: 0.70 points		1 of 4 Credits	All Levels		required.)
Pol 1 Global Warming Potential (GWP) of Insulants GWP of Insulants A credit is awarded where <u>all</u> substances (in manufacture AND in less than 5. Select the most appropriate option — All insulants have a GW OR Some insulants have a GW	1 of 1 Credits	-			
Pol 2       Credits are awarded on the basis of the operation of the space and wat dwelling.         Emissions       Select the most appropriate option — Greater than 100 mg/kWh         OR       Less than 100 mg/kWh         OR       Less than 70 mg/kWh         OR       Class 4 boiler         OR       Class 5 boiler         OR       All space and her requirements are met not produce NOx emission	NOx emissions arising from er heating system within the /h	0 of 3 Credits	-		

CATEGORY 7 HEALTH & WELLBEING Overall Level: 3	Overall Score	60.15		Evidence Required
% of Section Credits Predicted: 75.00%	Credits	Level	Assumptions Made	(The below cells can be formatted by assessors if
Contribution to Overall Score: 10.50 points	9 of 12 Credits	No level		required.)
Hea 1 Daylighting       Credits are awarded for ensuring key rooms in the dwelling have high daylight factors (DF) and a view of the sky.         Select the compliant areas	0 of 3 Credits	-		
Hea 2 Sound Insulation       Credits are awarded where performance standards exceed those required in Building Regulations Part E. This can be demonstrated by carrying out pre-completion testing or through the use of Robust Details Limited.         Select a type of property       Image: Credits are awarded where performance standard properties: - Separating walls and floors only exist between non habitable spaces         Select a performance standard       Image: Credits are awarded performance standard not sought         Select a performance standard not sought       Image: Credits are awarded performance standard not sought         Select a performance standard not sought       Image: Credits are awarded performance standard not sought         OR       Airborne: 3db higher; Impact: 3dB lower       Image: Credits are awarded performance standard	4 of 4 Credits	-		

Issue		Credits	Level	Assumptions Made	Evidence Required
Hea 3 Private Space	A credit is awarded for the provision of an outdoor space that is at least partially private. The space must allow easy access to all occupants. Will a private/semi-private space be provided? Yes, private/semi-private space will be provided OR No private/semi-private space	1 of 1 Credits			
Hea 4 Lifetime Homes	Mandatory Requirement:       Lifetime Homes is mandatory when a dwelling is to achieve Code Level 6.         Tradable credits:       Credits are awarded where the developer has implemented all of the principles of the Lifetime Homes scheme.         Mandatory Requirement	4 of 4 Credits	No level		

CATEGORY 8 MANAGEMENT Overall Level: 3		Overall Score	60.15		Evidence Required	
% of Section	on Credits Predicted: 77.00%		Credits	Level	Assumptions Made	(The below cells can be formatted by assessors if
Contributi	on to Overall Score: 7.77 points		7 of 9 Credits	All Levels		required.)
Man 1 Home User Guide	Credits are awarded where a simp dwelling covering information rele home occupier, in accordance with 1 Tick the topics covered by the Home Us Operational Issues? Site and Surroundings? Is available in alternative	le guide is provided to each evant to the 'non-technical' the Code requirements. er Guide er Guide formats?	3 of 3 Credits	-		
Man 2 Credits are awarded where there is a commitment to comply with best practice site management principles using either the Constructors Scheme Considerate Constructors Scheme or an alternative locally/ nationally recognised scheme.		a commitment to comply principles using either the an alternative locally/				
	Select the appropriate scheme and score     No scheme used <u>Considerate Constructors</u> OR Best Practice: Score betv     OR Best Practice+: Score bete <u>Alternative Scheme*</u> OR Mandatory + 50% optional     OR Mandatory + 80% optional     * In the first instance, contact a Code Sc     considering to use an alternative scheme	e O veen 24 and 31.5 O ween 32 and 40 O trequirements O trequirements O ervice Provider if you are e.	1 of 2 Credits	-		
Man 3 Construction Site Impacts	Credits are awarded where there is a to operate site management proceduate operate site management proceduate operate site management proceduate operate site management proceduate operate operate operate operation op	a commitment and strategy ures on site as following: <u>set targets, where</u> e activities	1 of 2 Credits	-		

Issue		Credits	Level	Assumptions Made	Evidence Required
Man 4 Security	Credits are awarded for complying with Section 2 - Physical Security from Secured by Design - New Homes. An Architectural Liaison Officer (ALO), or alternative, needs to be appointed early in the design process and their recommendations incorporated.				
	Secured by Design Compliance Credit not sought OR Secured by Design Section 2 Compliance	2 of 2 Credits	-		

CATEGORY 9 ECOLOGY Overall Level: 3		Overall Score 60.15			Evidence Required
% of Section Credits Predicted: 55.00%		Credits	Level	Assumptions Made	(The below cells can be formatted by assessors if
Contributi	on to Overall Score: 6.66 points	5 of 9 Credits	All Levels		required.)
Eco 1 Ecological Value of Site	One credit is awarded for developing land of inherently low value.  Select the appropriate option  Credit not sought  OR Land has ecological value  OR Land has low/ insignificant ecological value*	0 of 1 Credits	-		
	* Low ecological value is determined either a) by using Checklist Eco 1 across the whole development site; or b) where an suitably qualified ecologist is appointed and can confirm or c) produces an independent ecological report of the site, that the construction zone is of low/ insignificant value; AND the rest of the development site will remain undisturbed by the works.				
Eco 2 Ecological Enhancement	A credit is awarded where there is a commitment to enhance the ecological value of the development site. Tick the appropriate boxes Will a Suitably Qualified Ecologist be appointed to recommend appropriate ecological features? AND Will all key recommendations be adopted? AND 30% of other recommendations be adopted?	1 of 1 Credits	-		
Eco 3 Protection of Ecological Features	A credit is awarded where there is a commitment to maintain and adequately protect features of ecological value. Type and protection of existing features Site with features of ecological value? OR Site of low ecological value (as Eco 1)? AND All* existing features potentially affected by site works are maintained and adequately protected? If a suitably qualified ecologist has confirmed that a feature can be removed due to insignificant ecological value or poor health conditions, as long all the rest have been protected, then this box can be ticked.	1 of 1 Credits	-		

Issue		Credits	Level	Assumptions Made	Evidence Required
Eco 4 Change of Ecological Value of Site	Credits are awarded where the change in ecological value has been calculated in accordance with the Code requirements and is calculated to be: Change in Ecological Value Major negative change: fewer than -9 Minor negative change: between -9 and -3 OR Neutral: between -3 and +3 Minor enhancement: between +3 and +9 Major enhancement: greater than 9	2 of 4 Credits	-		
Eco 5 Building Footprint	Credits are awarded where the ratio of combined floor area of all dwellings on the site to their footprint is: Ratio of Net Internal Floor Area: Net Internal Ground Floor Area Credit Not Sought O OR Houses: 2.5:1 OR Flats: 3:1 O OR Houses: 3:1 OR Flats: 4:1 O OR Houses & Flats Weighted (2.5:1 & 3:1) O OR Houses & Flats Weighted (3:1 & 4:1) O	1 of 2 Credits
