

Design & Access Statement

Our application is for two additional air conditioning units for our London office. The units will be situated on our flat roof to the back of the premises for the purpose of cooling 2 editing suites, which houses important television editing equipment.

The two units will be nestled in between already existing machines for our main offices.

The design of the units are all to normal specification – 2 x Fujitsu asya14LC and will be placed on vibrator beds to protect against additional noise.

Access to the flat roof is via a private courtyard where ladders can be placed safely against our building. As the units will be positioned together any maintenance to the units will be easy and straightforward for the company installing them.

All aspects of design, environment and noise levels have been taken into account for this install. The units will only ever be used during normal working hours, Monday to Friday and has six units already exist on this site the new units will not look out of place.
