

It is proposed to reinstate the original sash windows to the front of the house and copy the arch detailing over the windows. The original design can be seen at the adjoining house no 13. The bricks will match the original and will be properly keyed to the original structure. Pointing will be made to match the original pointing.

The rear extension being at the lower storey height will built of the same facing brick to give harmony to the lower level. However, as it is an new extension and is not rebuilding original structure there is to be a vertical glazed element to the flank elevation to separate the original from the new. This will give a visual break and allow the new extension to link with the original house but not need to copy in the same window style.

Thus we are now able to introduce differing windows/doors to the proposed rear extension. These sliding folding doors will be of aluminium and offer thermally broken frames. The glazing will be sealed units using the latest glazing specification to give a U value of 1.8 W/m2C
