

Aeris Large

## Aeris Segmented Optics

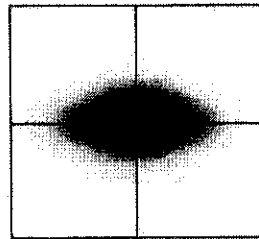

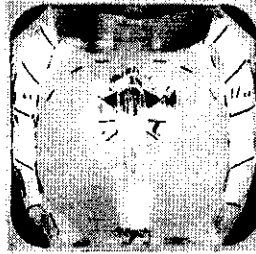

The Aeris range provides night-time performance as dramatic as its daytime appearance. High performance optics make the best use of new efficient lamps, resulting in low energy consumption. Specular segmented optic reflectors are precisely tuned for improved performance particularly at lower mounting heights maintaining proper scale with the luminaire and its environment.

A choice of up to four distribution types provides effective coverage of roadways, car parks, walkways, building perimeters and campus environments. All reflectors are rotatable through 90° increments for versatility. This modular style of optic allows both the large and medium luminaire to have similar distributions for uniformity in lighting schemes.

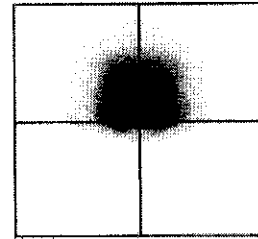

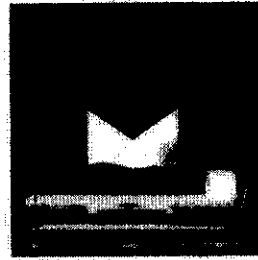

Asymmetric

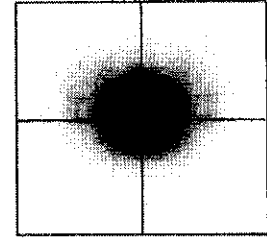

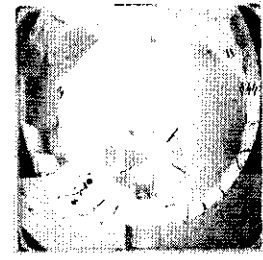

Street

Forward Throw Cut-Off

Forward Throw Wide

The unique nature of the Aeris optics virtually eliminates the stripes, or striations, normally associated with horizontal lamp luminaires, the forward throw cut-off provides even more light in front of the pole while retaining its true cut-off of back light.

Aeris range is a true architectural lighting instrument with performance to match its looks.
