NOTES

1. Ratings shown are net capacities which include a deduction for indoor fan motor heat.
2. On the figure the mark ○ show the max. at standard conditions.
On the figure the mark □ show rated capacity and rated coefficient of power input.
However the max. capacity is not guaranteed, except at standard condition.
3. On the tables □ show rated capacity and rated coefficient of power input.
4. SHC is based on each EWB and EDB
SHC* = SHC correction for other dry bulb
 $SHC^* = 0.02 \times AFR (\text{m}^3/\text{min}) \times (1-BF) \times (DB^*-EDB)$
Add SHC* to SHC.
5. Capacities are based on following conditions:
Outdoor air : 85 % RH, however, the condition on nominal capacity is 7°CDB/6°CWB (heating)
Corresponding refrigerant piping length : 7.5 m
Level difference : 0 m
6. Coefficient of power input is the percentage when the rated valve is defined as 1.00.
7. The value contains less than 5% error according to indoor unit type.
8. Heating capacity include the drop of frost formation.
9. Air flow rate and BF are tabulated below.

Pair

Model	FCQ71D	FCQ71B	FBQ71	FHQ71	FAQ71	FUQ71

NOTES

- Ratings shown are net capacities which include a deduction for indoor fan motor heat.
- On the figure the mark with ● show the max. total capacity at standard conditions.
On the figure the mark with ■ show rated capacity and rated coefficient of power input.
However, only rated capacity & CPI are guaranteed (maximal values NOT).
- On the tables show rated capacity and rated coefficient of power input.
- SHC is based on each EVB and EDB
SHC* = SHC correction for other dry bulb
 $SHC^* = 0.02 \times AFR (m^3/min) \times (DB^* - EDB)$
Add SHC* to SHC
- Capacities are based on following conditions:
Outdoor air : 85 % RH, however, the condition on nominal capacity is 7°CDB/6°CWB (heating)
Corresponding refrigerant piping length : 7.5 m
Level difference : 0 m
- Coefficient of power input is the percentage when the rated value is defined as 1.00.
- Rated values are guaranteed. Other values are accurate within an error of 5%.
- Heating capacity includes capacity drop due to defrost operation.
- Air flow rate and BF are tabulated below.

B. Stacked installation

1. Obstacles exist in front of the outlet side

2. Obstacles exist in front of the air inlet

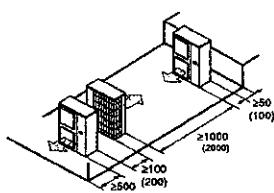

Do not stack more than one unit.

About 100mm is required as the dimension for laying the upper outdoor unit's drain pipe.

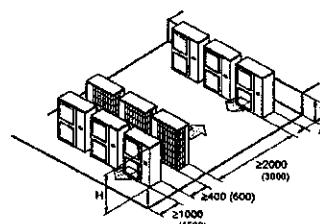

Get the portion A sealed so that air from the outlet does not bypass.

C. Multiple-row installation

1. Installation of one unit per row

2. Installing multiple units (2 units or more) in lateral connection per row

Relation of dimensions of H, A, and L are shown in the table below.

	L	A
$L \leq H$	$0 < L \leq 1/2 H$	150 (250)
$1/2 H < L$		200 (300)
$H < L$	Installation impossible

**Notes:**

- Depending on operation and installation conditions, the indoor unit can change over to freeze-up operation (indoor de-icing).
- To reduce the freeze-up operation (indoor de-icing) frequency, it is recommended to install the outdoor unit in a location not exposed to wind.
