EXECUTIVE SUMMARY	
Scope of works	To undertake a combined geotechnical and environmental ground investigation with associated interpretation and assessment.
Form of Development	An extension to the existing school consisting of a steel frame part (one) storey hall and part four storey main structure.
Site Description	The site comprised an irregular shaped parcel of land which sloped very gently down to the north. The site was in use as a car park associated with the Cavendish School. The whole site was laid with tarmac or. Access to the site was to the north from Inverness Street.
Ground Conditions	The ground conditions comprised a variable thickness of Made Ground over the London Clay Formation. Made Ground was encountered to a depth in excess of 2.70mbgl at the location of BH1A.
Groundwater	Water was encountered at depths of between 0.95m bgl and 1.50m bgl within three of the intrusive locations (TP8, WS1 & BH1A). These are likely to be accumulations of perched water held within more permeable deposits on top of the relatively impermeable London Clay Formation and are not considered representative of the true groundwater level.
Foundations	Conventional shallow foundations may be suitable to the ground conditions encountered in some parts of the site. However, due to the depth of Made Ground in some areas an alternative form of foundations such as piles is likely to be most suitable. Recommended working loads for various length and depths of CFA pile are presented in the report. It is recommended that ground floor slabs be fully suspended.
Excavations	Both shallow and deeper excavations within the Made Ground are unlikely to remain stable and some form of temporary support is likely to be required. Both shallow and deeper excavations within the London Clay Formation are likely to remain relatively stable in the short to medium term.
Pavements	The Made Ground should be considered frost susceptible for pavement design purposes. For the clays of the London Clay Formation recommended that a CBR of 3% be assumed for pavement design.
Sub-surface concrete	Sub-surface concrete should be designed to Class DS-3 (AC2s) of BRE Special Digest 1.
Ground Gases	No gas protection measures are required and no further monitoring or assessment is warranted.
Radon Gas	No protection measures are required.
Soil contamination	The building footprint will effectively encapsulate the Made Ground beneath the site. Vapour pathways have been considered in the assessment
End users	No contaminant concentrations of concern above the respective SSAC have been identified on site, as such it is considered that no remedial action is required.
Built Environment	Barrier pipe is likely to be required for water supply pipes. The results should be forwarded to the appropriate utility company.
Waste Disposal	Based on the geo-chemical laboratory results, Made Ground and natural soils are likely fall into the Inert Waste category.
Discovery strategy	A discovery strategy should be employed, so that any evidence of possible unidentified contamination can be dealt with appropriately.
<p><i>This Executive Summary is intended to provide a brief summary of the main findings and conclusions of the investigation. For detailed information, the reader is referred to the main report ref. GE9737 – GARv1JK300414</i></p>	

1.0 INTRODUCTION

1.1 General

Geo-Environmental Services Limited (Geo-Environmental) was instructed by Ainsley and Partners on behalf of the Cavendish School, to undertake an investigation of the geotechnical and geo-environmental factors pertaining to the development at the Cavendish School, 31 Inverness Street, NW1 7HB.

1.2 Form of Development

It was understood that the proposed development was to comprise an extension to the existing school consisting of a steel frame part (one) storey hall and part four storey main structure.

1.3 Objectives

The data from the geotechnical investigation was to form the basis of an interpretation with respect to foundation design, pavement construction, concrete specification, excavation stability and other pertinent construction issues.

A Preliminary Risk Assessment (PRA) was undertaken as part of the desk study in accordance with CLR11, in order to provide a basis for the scope and rationale of the subsequent Phase II ground investigation. The data from Phase I and Phase II were then to form the basis of a subsequent Tier 1 Generic Quantitative Risk Assessment (GQRA). The objective of the risk assessments was to evaluate the risks posed to the proposed redevelopment, adjacent land uses and the wider environment, in the context of likely planning requirements, immediate liabilities under the Environment Act 1990 and risks posed to Controlled Waters under the Water Resources Act.

1.4 Standards

Where practicable, the ground investigation and subsequent geotechnical and environmental assessments were undertaken in accordance with the following documents and guidance:

- British Standards Institute - Code of Practice for Site Investigations (BS5930:1999).
- British Standards Institute - Code of Practice for the Characterisation and Remediation from Ground Gas in Affected Developments (BS8485:2007).
- British Standards Institute - Eurocode 7 – Geotechnical Design - Parts 1 & 2 (BS EN1997-1:2004 & BS EN1997-2:2007).
- British Standards Institute - Investigation of Potentially Contaminated Sites - Code of Practice (BS10175:2011).
- British Standards Institute - Soils for Civil Engineering Purposes (BS1377:1990).
- Building Research Establishment - The Performance of Building Materials in Contaminated Land (BRE255) (1994).
- Construction Industry Research and Information Association - Assessing risks posed by hazardous ground gases to buildings (C665) (2007).
- Department for Communities and Local Government - National Planning Policy Framework (2012).
- Department for Environment Food and Rural Affairs and Environment Agency - Model Procedures for the Management of Contaminated Land (CLR11) (2004).
- Department of Environment - Industry Profiles (1995 - 1996).
- Environment Agency - Guidance for waste destined for disposal in landfills (2006).
- Environment Agency - Guidance on Requirements for Land Contamination Reports (2005).
- National House Building Council, Environment Agency & Chartered Institute of Environmental Health - Guidance for the Safe Development of Housing on Land Affected by Contamination (R&D Publication 66) (2008).

- National House Building Council - Guidance on evaluation of development proposals on sites where methane and carbon dioxide are present (10627-R01[04]) (2007).
- National House Building Council – Standards, Chapter 4.1 Land Quality - Managing Ground Conditions (1999).

1.5 Conditions

This report does not purport to be a “Geotechnical Design Report” as defined in Clause 2.8 of Eurocode 7 (Geotechnical Design BS EN 1997-1:2004) and some of the data used to support this geotechnical assessment may not be fully compliant with that design code. It is possible that further detailed ground investigations could be required to facilitate the detailed geotechnical design process and should be carried out on a structure specific basis if necessary.

The data collected from the investigations have been used to provide an interpretation of the geotechnical and/or environmental conditions pertaining to the site. The recommendations and opinions expressed in this report are based on the data obtained. Geo-Environmental takes no responsibility for conditions that either have not been revealed in the available records, or that occur between or under points of physical investigation. Whilst every effort has been made to interpret the conditions, such information is only indicative and liability cannot be accepted for its accuracy.

It should be noted that in particular the concentrations and levels of mobile liquid and gaseous materials are likely to vary with time. The results obtained may therefore only be representative of the conditions at the time of sampling. This report should not be taken as any guarantee that a site is free of hazardous or potentially contaminative materials.

Information contained in this report is intended for the use of the Client and Geo-Environmental can take no responsibility for the use of this information by any party for uses other than that described in this report. Geo-Environmental makes no warranty or representation whatsoever express or implied with respect to the use of this information by any third party. Geo-Environmental does not indemnify the Client or any third parties against any dispute or claim arising from any finding or other result of this investigation report or any consequential losses.

Assessment criteria or other parameters developed for the evaluation of contamination on this site are based on a number of assumptions regarding exposure and toxicology. Exposure to contaminants and levels of adverse effects may therefore vary. Whilst reasonable care and expertise has been employed in the development of such criteria, no liability is accepted in this respect. Other criteria or guidance on the development of assessment criteria may be published in the future and no liability is accepted in this respect.

2.0 DESK STUDY SUMMARY

The findings of the Phase I desk study are presented in the following section. A copy of the historic maps and other information obtained as part of the desk study are presented in Appendix A. Comments made in the following section regarding possible ground conditions on the site are based purely on the desk study.

2.1 Site Description

At the time of the intrusive works, the site comprised an irregular shaped parcel of land which was generally flat with a slight slope down to the north. The site was in use as a car park associated with the Cavendish School. The whole site was laid with tarmac or slate covered flower beds. Access to the site was to the north from Inverness Street.

There were no buildings present on the site. There were flower beds running along the eastern and western extents of the site with one raised bed to the north of the eastern extent of the site.

The site was bounded to the east by a probation centre, the west by a residential property and a commercial property and to the north by Inverness Street. A couple of deciduous semi-mature trees were identified along the northern extent of the site within areas surrounded by tarmac. The surrounding area was mostly residential with associated gardens.

2.2 Historic Mapping

Historic maps dating back to 1875 were obtained as part of the desk study. A summary of the apparent key features noted on the map extracts both on the site and within the local area is presented in Table 2.1.

Table 2.1

Summary of Historical Map Extracts

Date	On Site	Off Site
1875	A residential property was shown on the north of the site. The remainder was indicated to comprise residential gardens.	The surrounding area was shown to be mostly residential. A pianoforte manufactory was labelled approximately 160m north-west of the site. A number of wharfs clustered around Hampstead Road lock were located approximately 150m north-west of the site. The London and North Western Railway runs in a north westerly to south easterly direction approximately 200m to the south west. A brewery was labelled approximately 250m north-north-east of the site.
1882	No changes shown.	No significant changes shown.
1896	No changes shown.	No significant changes shown.
1916	No changes shown.	A school was labelled immediately adjacent to the south of the site. The pianoforte manufactory was no longer labelled.
1920	No changes shown.	A hospital was labelled approximately 250m to the east of the site.
1938	No changes shown.	No significant changes shown.
1946	(Aerial Photograph) No changes shown.	(Aerial Photograph) Residential buildings to the north-east appear to have been replaced with a commercial building.
1951	No changes shown.	No significant changes shown.
1953	Structures were shown along the site's western boundary.	An ophthalmic instruments works was labelled approximately 40m east of the site. A Corporation Yard was labelled approximately 75m to the north-west. A

		printing Works was labelled approximately 125m north-west of the site. An engineering works was also shown approximately 150m to the north-west. A chemical works was labelled approximately 100m south-south-west of the site, with an optical works and electrical sub-station being shown approximately 120m to the south-west. A joinery works and sheet metal works were shown approximately 200m and 240m to the south-west, respectively. A light engineering works was labelled approximately 250m east of the site. The brewery to the north-north-east of the site was relabelled as a motor engineering works. A garage was labelled approximately 175m north-west of the site.
1954	No changes shown.	No significant changes shown.
1957	Unclear at this scale of mapping.	No significant changes shown.
1968	Unclear at this scale of mapping.	No significant changes shown.
1969	No changes shown.	The commercial building to the north-east, running adjacent to the site on Arlington Road, has been relabelled as a cinema. A builder's yard was labelled to the immediate west of the site. A vehicle testing station was shown approximately 25m north-west of the site. The chemical works to the south-south-west was no longer labelled.
1971	No changes shown.	No significant changes shown.
1974	No changes shown.	No significant changes shown.
1975	No changes shown.	No significant changes shown.
1982	The property on the north of the site was no longer shown. The structures along the western boundary were no longer shown.	No significant changes shown.
1991	No changes shown.	The motor engineering works to the north-north-east of the site was no longer labelled.
1995	No changes shown.	The school to the south was labelled as the Cavendish School. The works to the east was no longer labelled. The vehicle testing station to the north was no longer labelled (the site appeared to have been redeveloped for residential use).
2006	No changes shown.	No significant changes shown.
2013	No changes shown.	No significant changes shown.

2.3 Geology

With reference to British Geological Survey (BGS) mapping, the geology of the site was anticipated to comprise the London Clay Formation.

The London Clay Formation comprises grey fissured clay, weathering to brown near surface. Concretions of argillaceous limestone in nodular form (Claystones) occur throughout the formation. Crystals of gypsum (Selenite) are often found within the weathered part of the London Clay, and precautions against sulphate attack to concrete are sometimes required.

2.4 Hydrogeology

With reference to Environment Agency mapping, the bedrock (London Clay Formation) is classified as an Unproductive stratum. No superficial deposits were anticipated on site.

Unproductive strata are rock layers or drift deposits with low permeability that have negligible significance

for water supply or river base flow.

Furthermore, the site was indicated to be outside of any groundwater Source Protection Zone (SPZ). An SPZ is a protection zone placed around a well or borehole that supplies groundwater of potable quality.

In addition, no recorded pollution incidents, licensed abstractions or discharge consents to controlled groundwater were identified as part of the desk study within a 250m radius of the site boundary.

2.5 Hydrology

The nearest surface water feature, a canal, was situated approximately 198m north-west of the site.

With reference to the Landmark mapping, the site was indicated to be outside of any indicative tidal or fluvial flood zones, and any associated flood warning areas.

The following discharge consents to surface waters were identified as part of the desk study within a 250m radius of the site boundary:

- Operator: The Jim Henson Studio; Property Type: Recreational & Cultural; Location: Oval Road, Camden Town (228m north-west); Authority: Environment Agency; Effective Date: April 1997; Revocation Date: September 2005; Discharge Type: Trade Discharges – Cooling Water; Discharge Environment: Canal (Guc – Paddington Arm).
- Operator: Rushes Motion Control; Property Type: Recreational & Cultural; Location: Oval Road, Camden Town (228m north-west); Authority: Environment Agency; Effective Date: September 1994; Revocation Date: October 1996; Discharge Type: Trade Discharges – Cooling Water; Discharge Environment: Freshwater Stream/River (Guc – Paddington Arm).

No recorded pollution incidents to surface waters or surface water abstractions were identified as part of the desk study within 250m of the site boundary.

2.6 Geochemistry

A large portion of the UK's urban soils have naturally elevated concentrations of some potentially harmful chemicals. In some cases these exceed the Environment Agency CLR soil guideline value (SGV) and/or the Land Quality Management/Chartered Institute of Environmental Health (LQM/CIEH) generic assessment criteria (GAC). A summary of the estimated urban soil chemistry for the area is presented in the following table:

Table 2.2

Summary of Site Geochemistry

Determinand	Concentration (mg/kg)	In Excess of SGV/GAC*?
Arsenic	15 - 25	No
Cadmium	1.8	No
Chromium	60 - 90	No
Lead	>900	Yes
Nickel	15 - 30	No

NOTE: * Comparative SGV concentrations are for a residential end use with plant uptake

It should be noted that these values are not necessarily representative of the site's soil chemistry. Furthermore, SGVs and GACs are dependent on pH and soil organic matter content. Therefore, concentrations of specific determinands and the utilised SGV/GAC cannot be determined without site specific investigation and analysis.

2.6 Sensitive Land Uses

A search was made of environmentally sensitive areas including local and national nature reserves, areas of outstanding natural beauty (AONBs), nitrate zones, Ramsar sites, sites of special scientific interest (SSSIs), conservation areas, special protection areas and biosphere reserves.

No such land uses or designations were identified within 250m of the site boundary as part of the desk study.

2.7 Environmental Data

Searches of other various environmental databases were made as part of the desk study, including air pollution control sites, Part IIA contaminated land, Integrated Pollution Control (IPC) and Integrated Pollution Prevention and Control (IPPC) sites, registered radioactive substances, COMAH sites, explosives sites, Notification of Installations Handling Hazardous Substances (NIHHS) sites, planning permissions for sites involving hazardous substances, contemporary trade directories and fuel station registers.

The following Local Authority Pollution Prevention and Control site was identified within 250m of the site boundary:

- Paradise Cleaners Ltd, 58 Parkway, London. Dated January 2007; PG6/46 Dry Cleaning, located approximately 77m south.
- Smart Dry Cleaners, 104 Parkway, London. PG6/46 Dry Cleaners, located approximately 174m south.
- Jet Petrol Station, 120 Parkway, London. PG1/14 Petrol Filling Station, located approximately 219m south-west.

The following Registered Radioactive Substances entries were identified within 250m of the site boundary:

- Unilabs Clinical Pathology, Jamestown, London. Dated October 1998; Process Type: authorisation for the disposal of radioactive waste; Status: Application made in error; Located approximately 163m north-west.
- Omnilabs (UK) Ltd, Jamestown, London. Dated March 1991; Process Type: authorisation for the disposal of radioactive waste; Status: Revoked/cancelled; Located approximately 180m north-west.
- Spirogen Ltd, Royal College Street, London. Dated December 2006; Process Type: authorisation for the keeping, use and disposal of radioactive waste; Status: Revoked/cancelled; Located approximately 198m east.

In addition, the following potentially contaminative contemporary trade directory entries were identified within a 250m radius of the site boundary:

- Service Point, 46-52 Parkway, London, 67m south, printers; Status: Inactive.
- Paradise, 58 Parkway, London, 80m south, dry cleaners; Status: Active.
- IT Green, Unit 5 Parkway, London, 92m south, computer recycling & disposal; Status: Active.
- 1st Option Representation, 1 Parkway, London, 118m east, photographic processors; Status: Inactive.
- 24 Hour Mobile Tyres, 61 Parkway, London, 135m south, tyre repairs & retreading; Status: Active.
- Serviceteam Ltd, 28 Jamestown, London, 140m north, waste disposal services; Status: Inactive.
- Parkway Filling Station, Oval Road, London, 159m west, petrol filling station; Status: Inactive.
- KB Export, 81 Parkway, London, 168m south; scrap metal merchants; Status: Active.
- Max Fordham, 42-43 Gloucester Crescent, London, 169m west, engineering services; Status: Active.

- Smart Dry Cleaners, 104 Parkway, London, 177m south, dry cleaners; Status: Inactive.
- Smarts, 104 Parkway, London, 177m south, dry cleaners; Status: Active.
- Infolink Communications Ltd, 2 Camden Road, London, 188m east, telecommunications equipment & systems; Status: Inactive.
- Proxima Concepts, 2 Royal College Street, London, 198m east, medical & dental laboratories; Status: Active.
- Lightning Graphics, 1 Centric Close, Oval Road, London, 210m west, printers; Status: Inactive.
- National Tyres & Autocare, 107 Parkway, London, 226m south, tyre dealers; Status: Inactive.
- Snappy Snaps, 127 Camden High Street, London, 249m south-east, photographic processors; Status: Inactive.
- Camden PCT, 125-133 Camden High Street, London, 249m south-east, hospitals; Status: Inactive.

Furthermore, Parkway Filling Station (159m west) was also included as an entry within the fuel station register.

No other such land uses were identified within a 250m radius of the site boundary.

2.8 Geotechnical Data

The site lies within an area considered by the Coal Authority as unlikely to be affected by mining activities.

National databases for a number of different geological hazards have been compiled by the BGS, and a summary of the hazard data pertaining to the site itself is presented on the following table:

Table 2.3

Summary of BGS Geological Hazards

Hazard	Designation
Collapsible ground	Very Low
Compressible ground	No Hazard
Ground dissolution	No Hazard
Landslide	Very Low
Running sand	No Hazard
Swelling clay	Moderate

2.9 Ground Gases

A search of BGS recorded landfill sites, IPC registered waste sites, licensed waste management facilities, local authority recorded landfill sites, other registered landfill sites, waste transfer stations, and other waste treatment or disposal sites was undertaken as part of the desk study. Such sites may form an artificial source of ground gases, such as carbon dioxide and methane, where wastes are buried or disposed of to landfill.

The following two registered waste transfer sites were identified within a 250m radius of the site:

- Location: Jamestown Road, Camden, 126m north; License Holder: N.L.W.A; Authority: Environment Agency; Site Category: Transfer – Road; Date: June 1977.
- Location: Jamestown Road Recycling Centre, Camden, 157m north; License Holder: London Borough of Camden; Authority: Environment Agency; Site Category: Transfer; Date: October 1994.

In addition, the following licensed waste management facility was identified within a 250m radius of the site:

- Location: 28 Jamestown Road, London, 180m north-west; Operator Name: Camden London Borough Council; Authority: Environment Agency; Site Category: Household Waste Amenity Sites; License Status: Issued October 1994, surrendered July 1997.

No other such facilities or land uses were identified within a 250m radius of the site boundary.

2.10 Radon

Reference has been made to the Indicative Atlas of Radon in England and Wales (2007). The report indicates that the site lies in an area where radon protection measures are not required.

2.11 Previous Ground Investigations

Geo-Environmental was not aware of any previous ground investigations which may have been undertaken on the site.

2.12 Generic Contamination

There were no former industrial land uses of the site. However, parts of the site appeared to have been used as a private residence and associated gardens, as well as part of the school. These land uses are not covered by the National House Building Council (NHBC), Environment Agency (EA) and Chartered Institute of Environmental Health (CIEH) publication 'Guidance for the Safe Development of Housing on Land Affected by Contamination' (2008), which provides a summary of industrial profiles (1995 - 1996) published by the former Department of the Environment (DoE) (now part of the Department for Environment, Food and Rural Affairs [DEFRA]).

This aside, the near surface soils may have been impacted by inorganic pollutants such as heavy metals and asbestos, and organic pollutants such total petroleum hydrocarbons (TPH) and poly-aromatic hydrocarbons (PAHs) through direct placement/introduction of materials such as ash, clinker or the like during the historic use of the site and through aerial deposition.

3.0 PRELIMINARY RISK ASSESSMENTS

Based on the findings of the desk study, the following sections summarise the anticipated geotechnical and environmental factors likely to impact the site.

3.1 Geotechnical Risk Assessment

The following factors that might impact the geotechnical condition of the site were identified as part of the desk study:

- The presence of potentially shrinkable soils which may impact upon foundation design and construction where trees are present, removed and/or proposed.
- The possible presence of deep Made Ground due to former foundations, which may impact upon foundation design and construction.

3.2 Environmental Conceptual Model

3.2.1 Methodology

A Preliminary Risk Assessment (PRA) and Conceptual Site Model (CSM) have been prepared in accordance with CLR11 based on information obtained as part of the desk study. Possible risks associated with potential sources of contamination and sensitive receptors identified have been assessed following a source-pathway-receptor (SPR) approach in accordance with current UK protocols.

A risk may only exist where a plausible SPR linkage is present, and where the quantity or concentration of a contaminant is sufficient so as to pose harm. Under the statutory definition, "Contamination" may only strictly exist where contaminants pose a risk of harm to a receptor. Risk may be defined as a function of the likelihood and severity of any adverse effects arising from contamination. The risk classification has been assessed in accordance with CIRIA C552 (Rudland *et al.*, 2001). A summary of how the risks are derived and their definitions are presented in Table 3.1 and 3.2.

Table 3.1

Risk Ratings Matrix

		Consequence			
		Severe	Medium	Mild	Minor
Probability	High Likelihood	Very high risk	High risk	Moderate risk	Moderate/low risk
	Likely	High risk	Moderate risk	Moderate/low risk	Low risk
	Low Likelihood	Moderate risk	Moderate/low risk	Low risk	Very low risk
	Unlikely	Moderate/low risk	Low risk	Very low risk	Very low risk

Table 3.2

Risk Ratings Definition

Risk Rating	Definitions
Very high risk	<p>There is a high probability that severe harm could arise to a designated receptor from an identified hazard, OR, there is evidence that severe harm to a designated receptor is currently happening.</p> <p>This risk, if realised, is likely to result in a substantial liability.</p> <p>Urgent investigation (if not already undertaken) and remediation are likely to be required.</p>
High risk	<p>Harm is likely to arise to a designated receptor from an identified hazard</p> <p>Realisation of the risk is likely to present a substantial liability.</p> <p>Urgent investigation (if not already undertaken) is required and remediation works may be necessary in the short term and are likely over the longer term.</p>
Moderate risk	<p>It is possible that harm could arise to a designated receptor from an identified hazard. However, it is either relatively unlikely that any such harm would be severe, or if any harm were to occur it is more likely that the harm would be relatively mild.</p>
Moderate to low risk	<p>It is possible that harm could arise to a designated receptor from an identified hazard. However, it is unlikely that any such harm would be severe, or if any harm were to occur it is probable that the harm would be relatively mild.</p>
Low risk	<p>It is possible that harm could arise to a designated receptor from an identified hazard, but it is likely that this harm, if realised, would at worst normally be mild.</p>
Very low risk	<p>There is low possibility that harm could arise to a receptor. In the event of such harm being realised it is not likely to be severe.</p>

3.2.2 Summary of Plausible Sources

Possible sources of contamination identified or discounted as part of the desk study are summarised in Table 3.3.

Table 3.3

Possible Sources of Contamination

Source	Description	Comments
Made Ground and near surface soils	General background chemical quality of the near surface soils	Possible elevated metals, organic and inorganic contaminants.

3.2.3 Summary of Plausible Pathways

The plausible pathways are summarised below:

- direct contact (soil, dust and vegetable ingestion, dermal contact and dust inhalation);
- ground gas inhalation;
- vertical and lateral migration including leaching;
- root uptake; and
- chemical attack of infrastructure (including water supply pipes) and building foundations.

3.2.4 Summary of Plausible Receptors

Potential receptors associated with the site and its development, identified or otherwise discounted, are summarised on Table 3.4.

Table 3.4

Possible Receptors of Contamination

Receptor	Description	Comments	Plausible
End Users	Occupants of the proposed development (school children).	The development will not have any areas of soft landscaping.	Yes
Soft Landscaping	Areas of planting including lawns, shrubs, trees, etc.	Soft landscaping areas are not proposed.	No
Water Supply Pipes	Plastics for potable water supply pipes may be laid in contact with contaminated soils.	Significant depths of Made Ground are anticipated, although limited contamination of the near surface soils may exist.	Yes
Buildings & Infrastructure	Buried concrete for foundations etc. may be laid in contact with contaminated/aggressive soils.	Significant depths of Made Ground are anticipated, although limited contamination of the near surface soils may exist.	Yes
Adjacent Land Users	Sensitive land uses identified within the immediate vicinity.	Adjacent land uses are mostly residential.	Yes
Groundwater	Controlled waters contained within the aquifer(s) beneath the site.	The site overlies an Unproductive stratum outside of any SPZ.	No
Surface Water	Controlled waters within lakes, rivers, and ponds, etc., or coastal waters.	The nearest surface water feature was a pond approximately 198m north-west of the site.	No

Site workers involved in the preparation and construction of the development have not been considered in this assessment as the principal contractor is duty bound under the current CDM Regulations to undertake their own risk assessments with respect to their employees.

Whilst the above sources and receptors have been identified, Table 6 summarises the identified plausible pollution linkages.

Table 3.5

Plausible Pollution Linkages

Potential Source/Media	Potential Receptors	Possible Pathways	Probability	Consequence	Risk & Justification
Contaminants of concern/Soil	End Users	Direct contact	Unlikely	Mild	Very Low The soft landscaped areas proposed are very limited and will comprise tubs or raised planters filled with chemically suitable clean imported topsoil. Therefore, pathways for exposure to the Made Ground will be severed.
	Adjacent Land Users	Direct contact	Unlikely	Mild	Very Low The soft landscaped areas proposed are very limited and will comprise tubs or raised planters filled with chemically suitable clean imported topsoil. Therefore, pathways for exposure to the Made Ground

Potential Source/Media	Potential Receptors	Possible Pathways	Probability	Consequence	Risk & Justification
					will be severed.
	Water Supply Pipes	Direct contact	Likely	Mild	Moderate to Low Water supply pipes are likely to come into contact with impacted soils depending upon depth of installation and extent of soil impact.
	Buildings and Infrastructure	Direct contact	Likely	Minor	Low Foundations and utilities will be placed within soils. However, the consequence is anticipated to be minor.

3.3 Preliminary Risk Assessment Summary

The PRA and CSM developed from the information gathered as part of the desk study process have identified several plausible pollutant linkages that exist in relation to the proposed development of the site. However, the preliminary risk rating for each linkage has been classified as very low, low and moderate to low and as such the site is considered overall as low risk.

3.4 Scope of Works

In summary, the following scope of works for the intrusive investigation was agreed with the Client:

- Utilities survey by specialist sub-contractor.
- The construction of five window sample boreholes across the site with regular sampling and in situ testing as appropriate to the conditions encountered.
- The installation of one groundwater and ground gas monitoring standpipe with one return monitoring visit. This was agreed with the Client prior to completing the desk study or intrusive investigation and thus enabled monitoring to be undertaken if a plausible pollutant linkage was identified during the desk study or intrusive investigation.
- The drilling of one 15.0m deep cable percussive borehole with regular sampling and in situ testing appropriate to the encountered conditions.
- Six hand excavated pits to reveal and plot the foundations of the existing buildings and boundary walls.
- Two machine excavated trial pits to determine the extent of any underground obstructions.
- Laboratory based testing for geotechnical and environmental parameters.

The cable percussion borehole encountered an obstruction at shallow depth and hence the borehole was repositioned. The cable percussion boreholes are consequently referenced BH1A and BH2.

3.5 Investigation Strategy

The desk study and PRA identified a limited number of possible sources of contaminants. The investigative positions were located in order to gain a broad coverage of the site to enable assessment of these potential sources. Tables 3.6 and 3.7 summarise the strategy of the environmental and geotechnical investigations.

Table 3.6

Summary of Environmental Investigation Strategy

Environmental Area of Concern	Investigation	Positions
General ground conditions (near surface soils)	Window sample and cable percussive boreholes located across the site, coupled with regular sampling and laboratory analysis	WS1 – WS5, BH1A, BH2, TP7 & TP8

Table 3.7

Summary of Geotechnical Investigation Strategy

Geotechnical Area of Concern	Investigation	Positions
Shrinkable soils	Window sample and cable percussive boreholes located across the site coupled with sampling and laboratory analysis.	WS1 – WS5, BH1A & BH2
Deep Made Ground	Window sample and cable percussive boreholes, and trial pits located across the site coupled with sampling and laboratory analysis.	WS1 – WS5, BH1A, BH2 & TP1 to TP8

Based on the agreed scope of works, it was possible to make an appraisal for each area of geotechnical and environmental concern identified within Tables 3.6 and 3.7. These are considered in the following sections of this report.

4.0 ENCOUNTERED CONDITIONS

A factual record of the conditions encountered during the physical investigation of the site is presented in the following sections.

For further details of the ground conditions, reference should be made to the exploratory hole logs presented in Appendix B, the monitoring results presented in Appendix C, the geotechnical and geo-chemical testing results in Appendix D and E, respectively and the utilities survey drawing in Appendix F.

The physical ground investigation works were undertaken during February and April 2014.

Unless stated otherwise, all depths are reported as metres below ground level (m bgl).

4.1 Soils

The ground conditions encountered were consistent with those anticipated from the desk study, i.e. a mantle of Made Ground overlying the London Clay Formation. The encountered ground conditions are summarised in Table 4.1.

Table 4.1

Summary of Ground Conditions

Top (m bgl)	Base (m bgl)	Description	Position
0.00	0.05 – 0.12	Tarmacadam	All
0.05 – 0.12	0.24 – 0.40	Concrete	All
0.24 – 0.40	0.95 – 1.70	Made Ground: Light brown and dark bluish brown silty sand, sandy clay and silty clay with abundant brick, occasional flint gravel, carbonaceous inclusions and rare pottery and tarmacadam.	All
0.95 – 1.70	15.00	London Clay Formation: Firm to stiff becoming very stiff brown, grey, orange and blue mottled silty clay with occasional selenite.	WS1, WS3, BH2, TP7 & TP8

The above summary does not take into account the soil conditions encountered within TP1 to TP6.

It should be noted that roots were encountered to a maximum observed depth of 2.60m bgl within BH2.

A summary of the findings from the trial pits excavated to reveal and record details of foundations to adjacent structures is presented in the table below.

Table 4.2

Trial Pit Summary

Trial Pit Reference	Total Step-Out	Depth of Underside	Remarks
TP1	>100mm	>600mm	Extremely restricted location and step-out was masked by concrete haunching associated with a kerb stone
TP2	450mm	1150mm	Founded on London Clay
TP3	Not Found	>1100mm	Extremely restricted location. Extensive concrete associated with fence post.
TP4	Not Found	>2200mm	Underside not proven
TP5	>100mm (probed)	>1400mm	Potential top of step-out found by probing at 1400mm.
TP6	330mm	1400mm	Founded on London Clay

For more detailed descriptions at specific locations, reference should be made to the exploratory hole logs, trial pit sketches and photographs presented in Appendix B.

4.2 Groundwater

Water was encountered at depths of between 0.95m bgl and 1.50m bgl within three of the intrusive locations (TP8, WS1 & BH1A). These are likely to be accumulations of perched water held within more permeable deposits on top of the relatively impermeable London Clay Formation and are not considered representative of the true groundwater level.

It should also be noted that changes in groundwater levels do occur for a number of reasons including seasonal effects and variations in drainage. Such fluctuations may only be recorded by the measurement of the groundwater level within a standpipe or piezometer installed within appropriate response zones.

4.3 Obstructions

Obstructions were encountered at several of the intrusive locations during the fieldwork. The depths and locations of the obstructions are summarised in the following table:

Table 4.3

Summary of Obstructions

Location	Depth (m bgl)	Obstruction Type
BH1A	2.70	Concrete
WS2	1.00	Concrete
WS4	1.29	Concrete
WS5	0.55	Concrete

The machine excavated trial pit (TP7) undertaken at the northern central portion of the site revealed the remnants of a former basement wall, the base of which was recorded at 1.55m bgl.

Therefore, the presence of obstructions elsewhere on the site cannot be completely discounted.

4.4 Ground Gases

A dual purpose gas and water monitoring standpipe was installed within window sample borehole WS4. This position was monitored for methane, carbon dioxide, oxygen and borehole gas flow on one occasion.

During the monitoring, no methane concentrations were detected and a maximum carbon dioxide concentration of 0.1%v/v was recorded. A minimum oxygen concentration of 20.6% v/v was recorded. A maximum positive borehole flow of 0.1l/hr was detected. Atmospheric pressure was recorded between at 1007mB.

4.5 Chemical Analysis

In order to assess the general chemical quality of the strata encountered, samples of soils recovered from the exploratory holes were submitted for analysis for a range of potential contaminants selected on the basis of the findings of the desk study and supported by the joint National House Building Council (NHBC), Environment Agency (EA) and Chartered Institute of Environmental Health (CIEH) publication, 'Guidance for the Safe Development of Housing on Land Affected by Contamination' (2008).

Soil samples were placed into plastic containers for general inorganic analysis and into amber jars for organic analysis. Samples were stored in temperature controlled conditions from sampling until receipt at the laboratory from which time sample preparation and storage was determined by testing requirements and in line with the laboratory's protocols.

Five soil samples were submitted for analysis of a comprehensive suite of commonly occurring contaminants based upon determinands listed within the above guidance, including asbestos screening.

A single composite sample of Made Ground was also collected and submitted for Waste Acceptance Criteria (WAC) analysis.

4.6 Geotechnical Testing

Atterberg Limit tests were undertaken on six samples of the London Clay Formation, with Plasticity Indices ranging between 38 and 51 and modified plasticity indices of between 30 and 51. The corresponding moisture content results ranged between 27% and 41%.

A further four Moisture Content Analyses were undertaken on samples of the London Clay Formation, with Moisture Contents ranging between 32% and 36%.

Water soluble sulphate and pH determinations were undertaken on five samples of the London Clay Formation. The results indicated pH values of between pH7.5 and pH8.1 with water soluble sulphate concentrations ranging between 0.21g/l and 1.54g/l.

In situ Standard Penetration Tests (SPTs) were undertaken within the cable percussive boreholes, in order to assess the consistency of the materials encountered. Generally these results ranged between equivalent SPT 'N' values of N=27 to N=31 with an overall trend of increasing results with depth.

Following the relationship proposed by Stroud and Butler 1975, where undrained shear strength (C_u) is related to SPT 'N' value by $C_u=4.5 \times N'$, the strength of the London Clay Formation was generally high, with a general trend of increasing undrained shear strength with depth.

Quick Undrained Triaxial tests were undertaken on five undisturbed samples taken at regular intervals from the London Clay Formation. The results indicate undrained shear strengths in the range of 75kPa (medium to high strength) to 150kPa (high to very high strength), with a general trend of increasing undrained shear strength with depth.

5.0 ENGINEERING CONSIDERATIONS

Subsequent to intrusive investigation of the site and receipt of the laboratory results, the following interpretative assessments have been made with respect to engineering considerations.

5.1 Traditional Foundations

Based on the ground and groundwater conditions encountered within the intrusive locations, it is considered that traditional foundations such as trench fill or strip, or isolated pad and beam could be appropriate for parts of the site. However, deep areas of Made Ground have been identified including an area believed to represent a former basement. On this basis, a piled foundation solution is likely to be most appropriate.

5.2 Piled Foundations

The construction of a piled foundation is a specialist job and the advice of a reputable local contractor familiar with the type of ground and groundwater conditions encountered on this site should be sought prior to finalising the design.

It is recommended that piled foundations pass through any Made Ground, disturbed or desiccated ground, and into the London Clay Formation.

Preliminary load capacities calculated for varying diameters of CFA piles taken into the London Clay Formation is given in the following table. The design should be used for preliminary purposes only as the actual working load is dependent on the type of pile and method of installation.

Table 5.1

Preliminary Pile Design

Pile Type	Diameter (mm)	Depth (m bgl)	Working Load (kN)
CFA	300	8.0	90
	450	8.0	150
	600	8.0	220
CFA	300	10.0	120
	450	10.0	200
	600	10.0	290
CFA	300	12.0	160
	450	12.0	260
	600	12.0	370

These working loads have been calculated on the basis of the ground and groundwater conditions encountered within the borehole and assume the following parameters:

- The contribution to the working load on the upper 3.00m has been ignored.
- A factor of safety of 3 was used on the skin friction and end bearing working loads respectively.

The bearing values given are applicable to single vertically loaded piles. Where groups of piles are to be constructed, the bearing value of each individual pile should be reduced by a factor of 0.8 and a calculation made to check for the factor of safety against block failure.

The piling contractor should be aware that one of the boreholes was cased to a depth of 1.50m in order to prevent collapse as drilling progressed. Furthermore, BH1A encountered a concrete obstruction at 2.70mbgl.

Given the presence of shrinkable soils and the depth of Made Ground across the site, it is recommended that all floor slabs be fully suspended.

5.3 Excavations

Both shallow and deeper excavations within the Made Ground are unlikely to remain stable and some form of temporary support is likely to be required.

Both shallow and deeper excavations within the London Clay Formation are likely to remain relatively stable in the short to medium term. However, the clays of the London Clay Formation will soften rapidly when exposed to water and therefore foundation trenches should be concreted or blinded immediately upon excavation.

The need for man entry into excavations should, where possible, be designed out. However, where this cannot be achieved it should only be permitted in accordance with an approved risk assessment, method statement and safe system of work.

5.4 Pavements

The engineering characteristics of Made Ground are variable and unpredictable and the CBR value of these materials does not predict the overall settlements that may occur. It would be prudent to assume the Made Ground on site to be deemed frost susceptible throughout thus a minimum pavement thickness of 450mm would be appropriate.

For pavements constructed on the natural London Clay Formation, the Transport and Road Research Laboratory Report (LR1132) entitled '*The Structural Design of Bituminous Roads*' (1984) cites an estimated equilibrium suction index of 3% for clays such as those of the London Clay Formation, under average construction conditions and low groundwater levels. Based on the geotechnical results, the London Clay Formation should be considered as being non-frost susceptible for pavement design purposes.

Any hard spots in the formation level such as old foundations may induce reflective cracking in the pavement and allowance should be made for removing any slabs or other hard spots etc. that may be present.

5.5 Sub-Surface Concrete

The results of the water soluble sulphate and pH analyses indicate that buried concrete should be designed in accordance with Class DS-3 of BRE Special Digest 1, with an ACEC class of AC-2s. The advice of this publication should be taken for the design and specification of all sub surface concrete.

5.6 Soakaways

Soakage testing was beyond the scope of the investigation. However, based on the ground and groundwater conditions encountered on site, it is considered unlikely that soakaways would perform satisfactorily on site. Therefore, an alternative form of surface water disposal should be sought.

6.0 ENVIRONMENTAL CONSIDERATIONS

A Generic Quantitative Risk Assessment (GQRA) incorporating the results of the desk study and ground investigation was undertaken, the findings of which are presented in the following sections.

6.1 Outline Risk Assessment

A number of plausible pollutant linkages were identified as part of the desk study, as summarised in Section 3.

6.2 Ground Gases

The desk study and preliminary risk assessment did not identify a plausible pollutant linkage between ground gases and end users due to the absence of a source. A single round of monitoring was included within the original scope of works (as stated in Section 3.4) and this verified the preliminary risk assessment.

Therefore, on the basis of the ground gas assessment and supported by the data presented in Appendix D, it is considered that the site's gassing regime is representative of Characteristic Situation 1 (BS8485 and CIRIA) and Green (NHBC) for which no gas protection measures would be required and no further monitoring or assessment is warranted.

6.3 Soil Contamination vs. End Users

Based on a visual assessment of the soils encountered, in conjunction with the known site history and proposed development, it was considered that the risk from any potentially contaminated soils at shallow depth was of very low order. On this basis, and given the sensitivity of the proposed development, a total of five soil samples were submitted to a UKAS and MCERTs accredited laboratory for general chemical screening including commonly occurring organic and inorganic contaminants, and asbestos screening.

The presence of a possible contaminant does not necessarily imply that a site or area is contaminated or that there is any unacceptable risk to human health. A Preliminary Quantitative Risk Assessment has been undertaken in accordance with CLR11, in order to evaluate any unacceptable risks posed to human health with respect to the proposed redevelopment. It should be noted that this assessment is protective of the chronic long-term effects of contaminants, which is also likely to be protective of any possible immediate acute effects.

A quantitative risk assessment has been undertaken by comparing the results of the laboratory chemical testing of shallow Made Ground soils against Site Specific Assessment Criteria (SSAC) generated using the Contaminated Land Exposure Assessment (CLEA) model v1.06 published by the Environment Agency, for a school use.

The assumptions made as part of the CLEA v1.06 calculations for a school end use are presented in Table 12.

Table 12

Assumptions for SSAC Calculation (CLEA v1.06 Software)

	Assumptions			Comments
Land Use	Residential without plant uptake			Most suitable setting within the CLEA Model
Receptor	Female (res)			A conservative assumption using the most sensitive possible receptor
Receptor Age	3-11			Critical receptor age range for the school children
Building	Office (Post 1970)			Most suitable setting within the CLEA Model
Soil Type	Silt loam	pH 9	SOM 1%	Based on an average of the chemical laboratory results.
Exposure Pathways	Oral	N/A		No oral exposure anticipated based on development proposals.
	Dermal	N/A		No oral exposure anticipated based on development proposals.
	Inhalation	Indoor & outdoor dust & vapour		Default setting for land use.
Occupancy	days/year	hours/day (indoors)	hour/day (outdoors)	Assumptions based on school day (08.00 to 15.30)
	180	6	1.5	

Due to the site being hard covered, the only exposure pathway considered was through inhalation of vapours both indoors and outdoors. The CLEA model did not calculate any SSACs for metals as there is considered to be no risk of vapours from these contaminants.

With respect to organic contaminants such as PAHs, all results were several orders of magnitude below the calculated SSACs and as such there is considered to be no significant risk to the end users.

Therefore, no remedial measures are considered necessary with respect to soil contamination and end users.

6.4 Soil Contamination vs. Adjacent Land Users

The surrounding land uses are noted to be mostly residential. No contaminant concentrations of concern above respective guidelines for the proposed school land use have been identified within the soils on the site. As such, it is considered that no specific remedial action is considered to be warranted in relation to adjacent land users.

It is recommended that dust suppression techniques, e.g. damping down exposed soils, are employed during the demolition and construction phases on site in order to minimise the potential for airborne migration of specific hazards and to manage potential nuisance issues for adjacent land users.

6.5 Soil Contamination vs. Built Environment

Recommendations with respect to sulphate and buried concrete are made in Section 5.5. It is noted that no onerous precautions in this respect are warranted.

The current guidance on selection of materials for water supply pipes to be laid in contaminated land is contained in UK Water Industry Research's (UKWIR) report reference 10/WM/03/21 (re-issued 2010). However, the guidance is not mandatory and there have been concerns raised by various industry technical associations regarding the document and the methodologies proposed.

Although there are concerns regarding the document, in lieu of any further guidance in the first instance the results of this investigation have been compared with the proposed thresholds published in UKWIR Table 3.1. The results of the relevant chemical analyses indicate that several results from the sample taken from WS2 exceed the SVOC concentrations for PE or PVC pipe. As such, some form of barrier pipe is likely to be required.

It is recommended that the results of this investigation be presented to the water utility company as soon as reasonably practicable in order to confirm the pipe material.

As a matter of good practice, and to maximise the protection to utilities, it is recommended that clean, granular backfill is used in service runs and that marker tapes are used for all buried services.

6.7 Waste

6.7.1 Reuse of Material

In accordance with CL:AIRE Code of Practice (2011) materials are only considered waste if 'they are discarded, intended to be discarded or required to be discarded by the holder'.

The Code of Practice therefore allows soils to be reused on site where the following criteria are met:

- Pollution of the environment and harm to human health is prevented in reusing the excavated materials;
- The material are suitable for use (without any further processing);
- There is certainty of use; and
- The quantity that is absolutely necessary (and no more) is used.

In order to comply with the Code of Practice, a material management plan that confirms the above criteria are met has to be prepared. The material management plan must be reviewed by a 'Qualified Person' who then issues a declaration to the Environment Agency. Geo-Environmental can provide this service should it be required.

Where materials do not meet the required criteria, it may be possible to treat them under an environmental permit so that they may be re-used on site.

6.7.2 Reuse of Waste

Where material is discarded as waste, it may still be possible to reuse the waste on site under a standard rules environmental permit or a U1 waste exemption. However, strict limits on the volumes that can be reused apply in these cases.

6.7.3 Disposal to Landfill

Under current legislation, where wastes are to be disposed of to landfill they may, depending on their classification, require pre-treatment. Pre-treatment shall comprise a chemical, physical (including sorting), thermal or biological process. The pre-treatment is required to change the characteristics of the waste, reduce its volume, reduce its hazardous nature, and facilitate its handling and enhance its recovery.

6.7.4 Waste Classification

The following information is provided for preliminary guidance purposes, as different facilities or operators may have differing acceptance criteria and further Waste Acceptance Criteria (WAC) analysis may be required to confirm the exact classification.

The results of the WAC analysis undertaken on a composite sample of the Made Ground encountered on site indicated these materials to be 'inert' waste, suitable for disposal at an inert waste facility. The natural soil arisings of the London Clay Formation are likely to be classified as 'inert' waste, suitable for disposal at an inert waste facility.

For those materials destined for landfill, the results of the chemical analyses should be provided to the proposed landfill site for confirmation.

6.9 Discovery Strategy

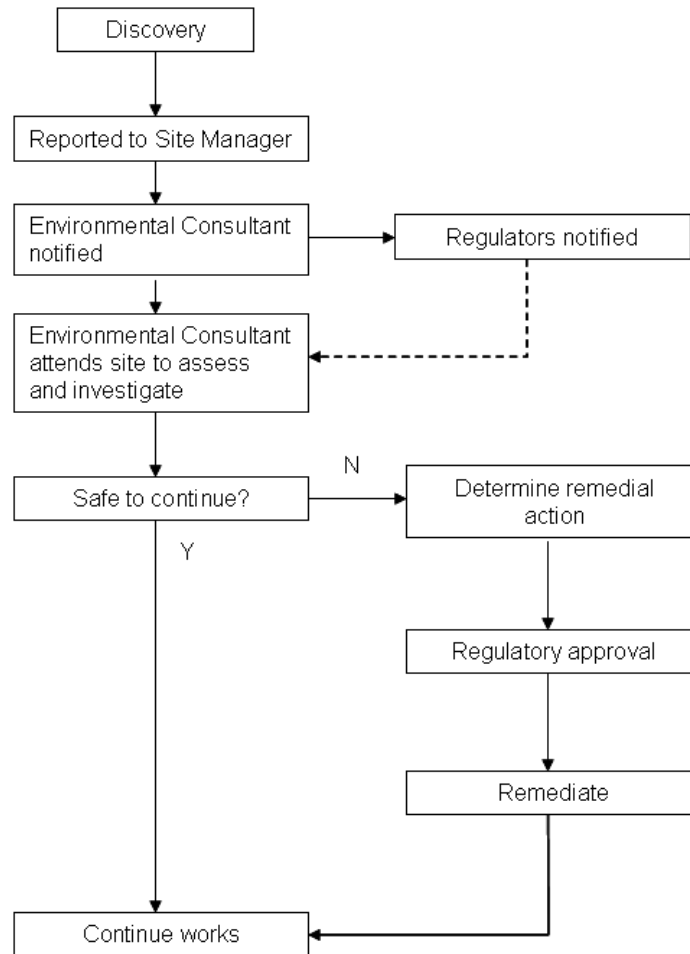

Whilst the investigation undertaken on the site to date is considered to be thorough, it remains possible that previously unexpected soil conditions may be encountered during the process of site demolition and construction.

Examples may include oily pockets within the soil, pockets of cement boarding or fibrous materials within the soil, black ashy materials, soils exhibiting strong odours, brightly coloured materials, and former structures or brickwork.

Should previously undiscovered contamination be encountered during the demolition/construction of the new buildings the following course of action should be adhered to:

- Works in the area of the suspected contamination should cease immediately. The ground workers should report any suspected contamination immediately to the Client's site supervisor. The supervisor should contact the Environmental Consultant, who should visit the site to assess the extent of the 'contamination'.
- The Environmental Consultant shall make records of their inspection, and pass details of these to the Local Authority.
- Where the conditions revealed differ from those previously anticipated, the Environmental Consultant shall take samples as deemed appropriate to be dispatched for appropriate chemical testing.
- Depending on the results of the testing either: 1) no further work will be required; 2) a further detailed risk assessment will be required; and/or 3) localised specific remedial measures will be necessary. Appraisal criteria will vary depending on the nature of the assessment.
- The results of any such testing will be sent to the Regulatory Authority for consultation. If remediation is required, the Regulatory Authority will be informed of the date and time of the proposed works.
- Remediation will be undertaken in accordance with a method statement submitted to the Local Authority for approval. The works shall be supervised by the Environmental Consultant who shall provide a Validation Report for the Local Authorities purposes.

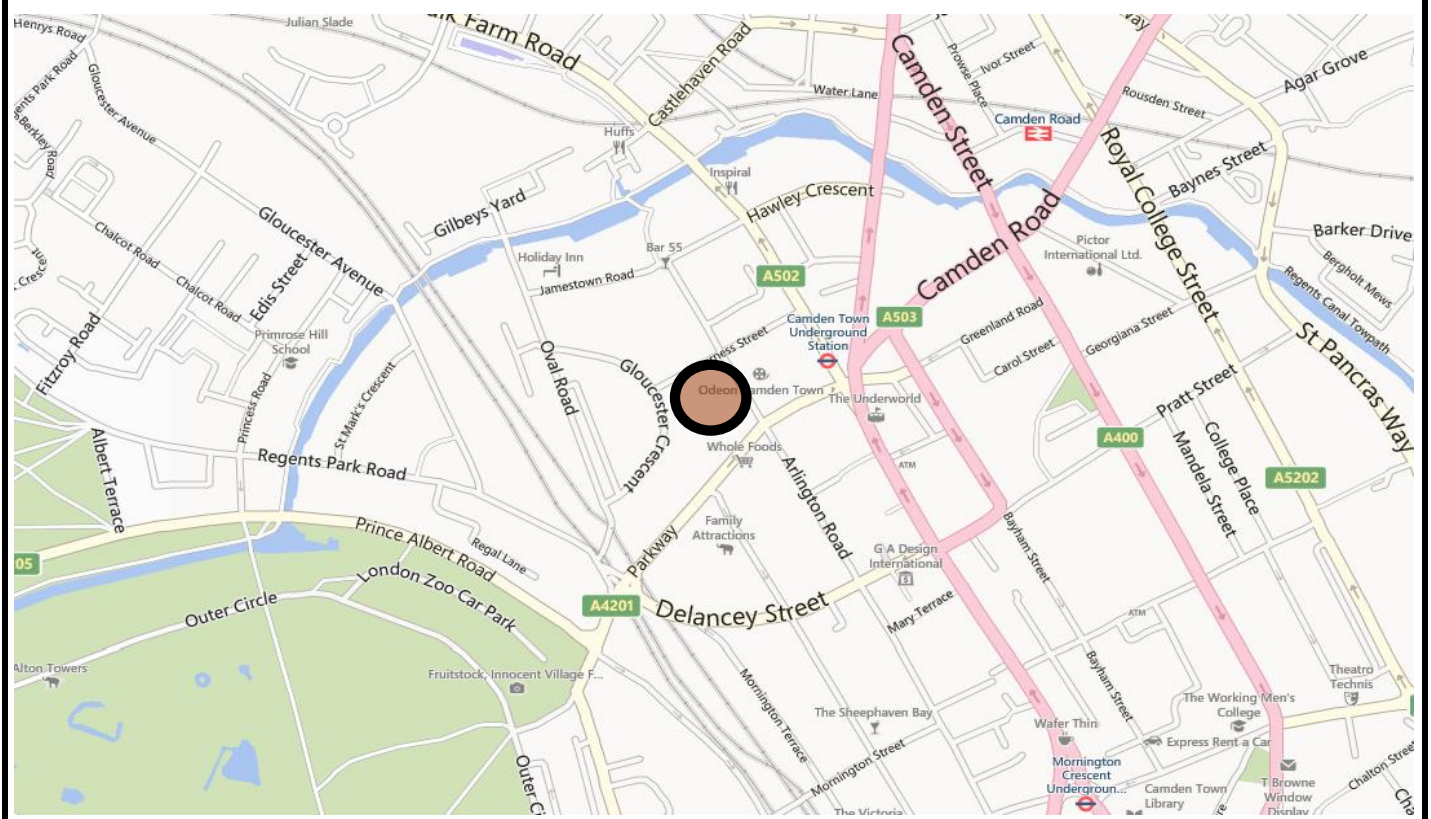

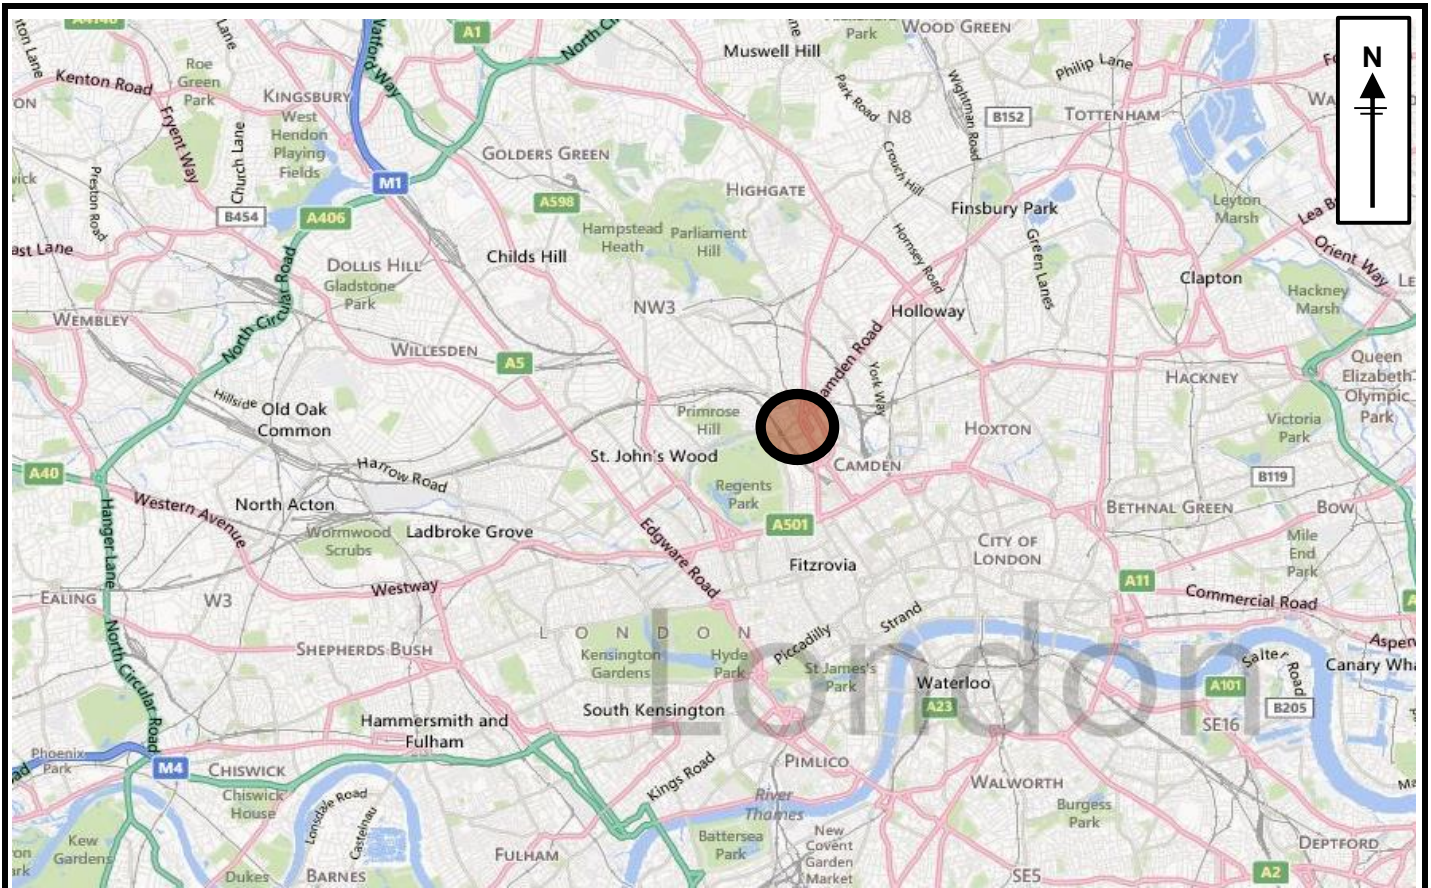

The process is summarised overleaf:

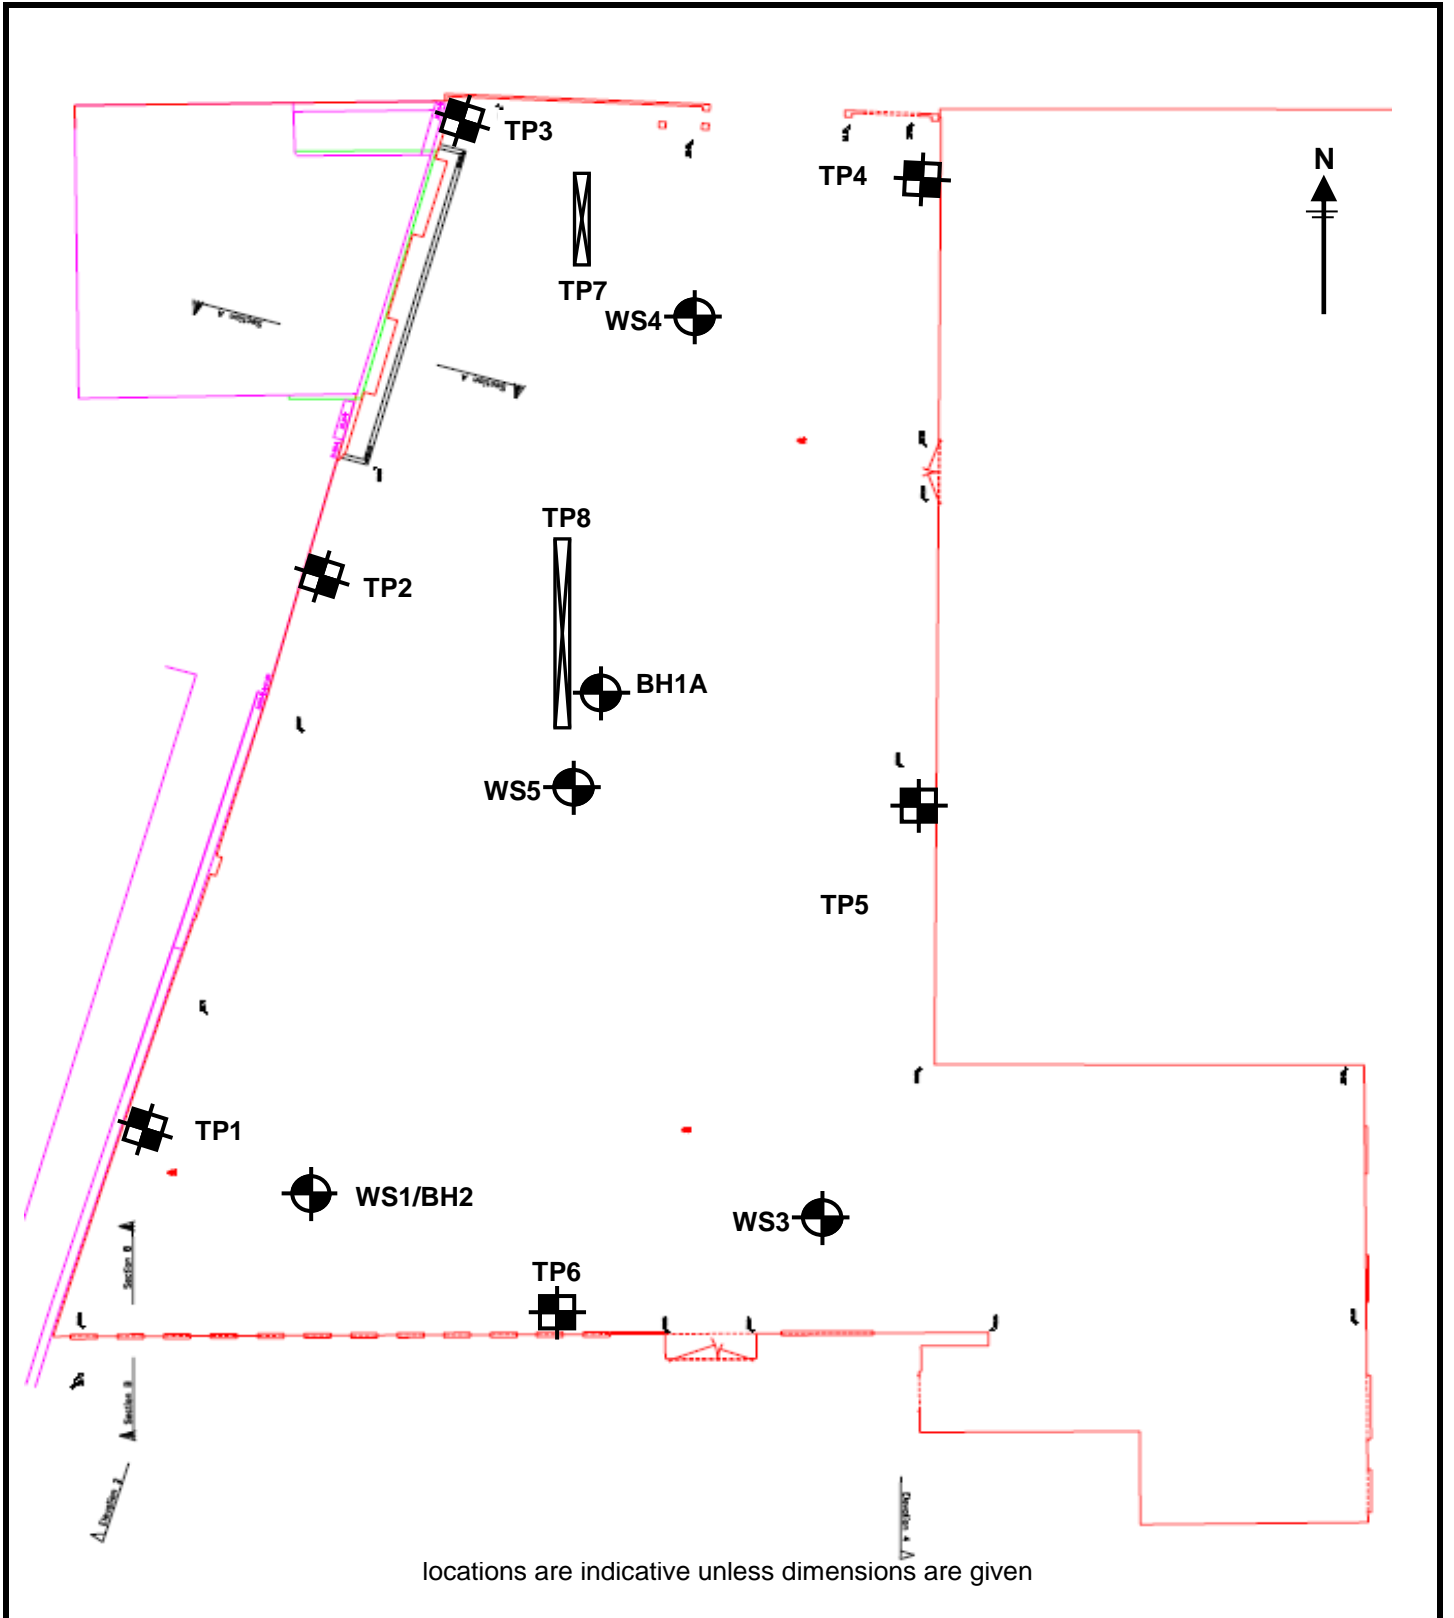

A copy of this strategy should be lodged on site, and provisions made to ensure that all workers are made aware of their responsibility to observe, report, and act on any potentially suspicious or contaminated materials they may encounter.

The background of the page features a decorative, wavy blue pattern that resembles stylized waves or a ribbon. The pattern is composed of several overlapping, curved bands of varying shades of blue, creating a sense of movement and depth. The word "FIGURES" is centered horizontally and positioned in the upper-middle section of the page, overlapping the top of the blue wave pattern.

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination. For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client.

In the attached datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Published 1875 - 1876

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Historical Aerial Photography

Published 1946

Source map scale - 1:1,250

The Historical Aerial Photos were produced by the Ordnance Survey at a scale of 1:1,250 and 1:10,560 from Air Force photography. They were produced between 1944 and 1951 as an interim measure, pending preparation of conventional mapping, due to post war resource shortages. New security measures in the 1950's meant that every photograph was re-checked for potentially unsafe information with security sites replaced by fake fields or clouds. The original editions were withdrawn and only later made available after a period of fifty years although due to the accuracy of the editing, without viewing both revisions it is not easy to spot the edits. Where available Landmark have included both revisions.

Ordnance Survey Plan

Published 1953 - 1954

Source map scale - 1:1,250

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Supply of Unpublished Survey Information

Published 1973 - 1975

Source map scale - 1:1,250

SUSI maps (Supply of Unpublished Survey Information) were produced between 1972 and 1977, mainly for internal use at Ordnance Survey. These were more of a 'work-in-progress' plan as they showed updates of individual areas on a map. These maps were unpublished, and they do not represent a single moment in time. They were produced at both 1:2,500 and 1:1,250 scales.

Map Name(s) and Date(s)

TQ2001SW 1973 1:1,250	TQ2001SD 1973 1:1,250	TQ2001SW 1973 1:1,250

Large-Scale National Grid Data

Published 1991

Source map scale - 1:1,250

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

Map Name(s) and Date(s)
