INTRODUCTION

PROJECT: St Georges Court

CUSTOMER: Gratte

MANUFACTURER: AERMEC SpA
Via Roma 44-37040
Bevilacqua (Verona) Italy

EQUIPMENT: 1-off NS2202XBEAK & 1 off NS3602XEAK

This project involves the supply and commissioning of 4-off NS type air-cooled water chillers. The chillers are manufactured by AERMEC and one of each type shall be run tested in the factory prior to delivery to site to verify performance. The chiller shall be performance witness tested in accordance with this document and witnessed by client's representatives at AERMEC's production facilities in Italy.

The test shall be carried out in three parts. Firstly, the chiller shall go through a functional pre-test and set-up procedure involving Aermec personnel. Then, on the date identified herein, the chiller shall go through a performance witness test followed by an acoustic test.

A. Functional pre-test (Aermec)

Complete a physical inspection of the unit and accessories. Check the integrity of the refrigerant circuit by pressure testing with nitrogen. Charge the unit and review operation of the refrigerant circuit. Measure the inlet and outlet water temperatures, flow rates and electrical performance of the chiller.

B. Witness performance test (Aermec + customers)

Run the chiller for one hour to achieve steady state conditions at 100% full load. The performance test is to be conducted 35°C ambient in the Production Test Chamber. Test operation of alarms. Simulate summer design operating conditions. Verify chiller performance against technical schedule. Issue a test certificate for customer approval.

C. Acoustic test (Aermec + customers)

The acoustic test is conducted outside the test chamber to eliminate the influence of the chamber fan noise and prepare it for the sound test run in the evening when the background noise is at a minimum. The chiller will be complete with both circuits running at full load.

ITINERARY

Witness Testing of AERMEC NS air-cooled water chillers

PROJECT: St Georges Court

Attendees

- Ray Miller – Aermec UK

Schedule

- TBC

METHOD STATEMENT

STANDARD FACTORY PERFORMANCE TEST

Equipment: 1 No. NS2202XBEAK air cooled water chiller
1 No. NS3602XEAK air cooled water chiller

Ref: Production Test Facility – Production Test Chamber

Standard Functional Test (carried out prior to witness test)

1. Pre-charge unit with nitrogen for checking purposes
2. Test for leakage
3. Discharge the circuit
4. Establish a vacuum to remove all gas and to eliminate moisture inside the refrigerant circuit
5. Charge the unit with R134a refrigerant
6. Control gas charge through the sight glass and pressure gauges
7. Connect the inlet and outlet water connections to the testing room plant
8. Set the water flow to the correct flow rate
9. Cable up the power to the unit
10. Carry out test of voltage and frequency on the electrical panel
11. Program the microprocessor control with basic working parameters
12. Set up the expansion valves and trim the refrigerant charge
13. Start up each compressor and test electrical data
14. Set up all the pressure switches
15. Initiate a controlled start-up of each condenser fan
16. Calibrate the various temperature and pressure probes on the circuit

Customer Witness Operational Performance Test

1. Test the alarms on the microprocessor:-
 - a. High pressure alarm
 - b. Low pressure alarm
 - c. Compressors alarm
 - d. Evaporator freeze alarm
 - e. Flow switch alarm
2. Test of probe failure
3. Set the design set-point and configure the unit for design working conditions
4. Run the chiller in the Production Test Chamber at full load conditions at design conditions:-

	NS 3602XE AK	NS 2202XBE AK
a. Chilled water:	6 °C / 12 °C	6 °C / 12 °C
b. Flow rate:	29.7 l/s	16.01 l/s
c. Glycol:	n/a	n/a
d. Design Ambient:	35°C	35°C

5. Record the performance data on the test report sheet
6. Run the chiller at full load conditions for one hour to reach steady state full load condition
7. Print a copy of the test report for customer approval
8. Test to be in accordance with ISO14511

WITNESS FACTORY ACOUSTIC TEST (AERMEC+CUSTOMER)

The Total Sound Power data declared for the NS 2202XBE AK is 90 dB(A)

The Total Sound Power data declared for the NS 3602XE AK is 92 dB(A)

Acoustic Test Procedure

- 1) Position the unit outside the test chamber to eliminate the influence of the chamber fan noise and prepare it for the sound test run
- 2) Prepare and calibrate the test instrument
Sound Intensity Analyser : BRUEL & KJAER PULSE
Measured Sound Level : Sound Power
Filter : A
- 3) Measure the sound intensity levels from one module within 1 metre from the unit all round and above in accordance with ISO 9614-2.2, Acoustics. All octave band readings to be taken simultaneously.
- 4) Shut down the chiller and measure the background noise level.
- 5) Record the results.
- 6) Calculate the sound pressure levels in accordance with ISO 3744:1994 Acoustics and Eurovent tolerances

Issue a test certificate for customer approval and signature

Attention: Mr Andrew Rogers

19th October 2012

Dear Andrew

RE: St. Georges Court – Chillers

With reference to our quotation Q12138-01J dated 13th September 2012, we are pleased to confirm the following:

- 1) The chillers proposed are generally in compliance with the amended Blyth and Blyth schedules as submitted by yourself via e-mail on 11th September, with the exception only of some of the data on the Office chillers due to reselection to a different type of chiller i.e. Screw chiller instead of Turbocor.
- 2) The chillers proposed are in compliance with the acoustic criteria detailed in the Hann Tucker report reference 17797/BS Rev C dated 10th August 2012.

Yours sincerely
on behalf of Aermec UK

A handwritten signature in black ink, appearing to read "Rex J. Murden".

TECHNICAL SUBMISSION

PROJECT: St Georges Court

CONTRACTOR : Gratte Brothers

MANUFACTURER: AERMEC

Refrigeration Plant : Qty 2 off Aermec NS 3602XE-AK ~ Office chillers

AERMEC ~ NS SERIES Air to water chillers

Series

Supply and delivery of the latest generation NS series air to water chiller unit. The machine is suitable for outdoor installation and has an IP24 protection level.

Cooling circuit

Two cooling circuits each with one screw compressor, exchanger and evaporator function. The cooling circuits are independent . (dual evaporators)

Description of the cooling circuit

Manufactured from copper pipe with welded joints in silver alloy including the following products. Thermostatic valve that modulates the flow of gas depending on the cooling capacity or electronic valve supplied as accessory. Dehydrator filter: with removable cartridge, it can withhold the impurities and eventual traces of humidity in the cooling circuit. Liquid indicator: used to check the refrigerant gas load and the eventual presence of humidity in the cooling circuit. Liquid and discharge line taps: allows to interrupt the refrigerant in the case of extraordinary maintenance. Solenoid valve: it closes when the compressor switches off, blocking the flow of refrigerant gas to the evaporator.

Operational fields

Possibility of producing cooled water with outdoor temperature up to 48 °C.

Refrigerant

The NS series is characterised by high efficiency ratios (EER) and seasonal efficiency ratios (ESEER) using R134a refrigerant,

Version

E: High efficiency version , with condenser coils of large surface and low noise operation. The unit is equipped with a fan speed adjustment device and compressor discharge muffler as standard.

Support frame

Made in hot galvanised sheet steel with suitable thickness and painted with polyester powders able to resist atmospheric agents through time.

All NS versions have an acoustic protection cover on the compressor as standard supply: it is made up of a thick galvanised steel compartment and has a sound-absorbent lining. Allows to reduce the sound power level emitted by the unit and also protects the compressors from atmospheric agents.

Compressor

Compressor, volumetric, with double screw rotor in steel alloy with ratio of 5:6 between the sections. Semi-hermetic construction with electric motor cooling by means of intake gas.

The compressor mounted on the NS units is optimised to function with R134a refrigerant. It is characterised by an extremely compact structure, double wall rotor casing with pressure compensation system, integrated oil separator structure in stages with relative oil management system, oil discharge temperature control, long-lasting bearings with pressure reduction device, non-return valve on exit of the delivery gas, intake gas filter with large surface and thin mesh to prevent the passage of impurities present inside the chiller circuit, indicator for controlling the level of the oil in the sump, anti-vibrating device for the reduction of the vibrations transmitted.

The electric motor has 2 poles of the squirrel cage type with circuit breaker protection against overloading of the motor and star-delta switching starting, managed by the circuit board, for the reduction of the peak current at every start up.

Power adjustment takes place by continuous modulation of the slide valve, moved hydraulically to check the power according to the load requested.

The compressor is always equipped with electric resistance for heating the oil: this prevents excessive liquefaction of the refrigerant in the oil with reduction of viscosity and is fed automatically during machine shutdown.

Thermostatic valve

X: Electronic thermostatic valve. It has a larger adjustment capacity with respect to traditional mechanical valves and with much quicker reaction times. This allows to work with minimum temperature of the water produced of -6 °C and with the possibility of modulation from 100% to 25% of the nominal capacity of each compressor.

Evaporator

Shell and tube direct expansion refrigerant-water exchanger, suitably dimensioned to obtain high performance. It is made up from a steel case with closed cell expanded elastomer anti-condensation covering; the shell and tube is made from copper pipes with a special profile that allows high exchange associated to efficient draining. The attachments are the Victaulic type. Respect the PED standard. Maximum working pressure: 16 bar.

Coils

°: The air-refrigerant exchangers with condenser function are coils with louvered fins, copper pipes and aluminum hydrophilic louvered fins, fixed by mechanical expansion of the pipes. Air-water exchangers with free-cooling function made up from louvered fin coils with smooth copper pipes and corrugated aluminum louvered fins.

Condenser fans

Fans are statically and dynamically balanced helical type, activated directly by electric motors, which are protected electrically by magnet-circuit breakers and mechanically by anti-intrusion metal grids, according to IEC EN 60335-2-40 Standard and fixed on the upper part of the framework.

Electric Control Board

Contains the power section and the management of controls and safety devices. It is in compliance with the IEC 60204-1 standard and the Directives regarding electromagnetic compatibility EMC 89/336/CEE and 92/31/CEE. Moreover, all cables are numbered for immediate recognition of all electric components.

Equipped with a door-lock isolating switch: the electric control board can be accessed by removing the voltage. Act on the opening lever of the control board itself. This lever can be locked using one or more padlocks during maintenance interventions to prevent the machine being powered up accidentally. Inside the control board is a control keyboard that allows complete control of the appliance.

Power supply

°: Three-phase + neutral power supply, 400V, 50Hz with fuses.

Safety devices and protections

The following devices are present in the chiller. Differential pressure gauge with IP54 protection level: it has the task of controlling that there is correct circulation of water; on the contrary block the unit.

Double high pressure switch (manual + tool) calibrated in the factory, positioned on the high pressure side of the chiller circuit, stops compressor functioning in the case of anomalous working pressures.

Chiller circuit safety valve, calibrated at 22 bar for the high pressure side and at 16.5 bar for the low pressure side: they intervene by discharging the overpressure in the case of anomalous pressures.

Always present are: the electric control board access door interlock system, fuses or magnet-circuit breakers for compressor protection, the magnet-circuit breakers protecting the fans and the magnet-circuit breakers protecting the auxiliary circuit.

Transducers

The unit is supplied complete with: input and output water temperature probe. A low pressure transducer is also present (one per circuit): this allows to view the compressor intake value on the board display; this is installed on the low pressure side of the chiller circuit and stop functioning of the compressor in the case of anomalous working pressures. The chiller also has a high pressure transducer (one per circuit): this allows to view the compressor intake value on the board display; this is installed on the low pressure side of the chiller circuit and stop functioning of the compressor in the case of anomalous working pressures.

Electronic adjustment

The electronic adjustment on NS chillers is made up of a control board for every compressor connected to each other in a network and a control panel with display. In the case of multi-compressor models the board that controls compressor n°1 is the "master" board while the others are "slaves". Transducers, loads and alarms relative to the control compressor are connected to each board, while the general machine ones are only connected to the master board.

The microprocessor has the following functions:

- remote ON/OFF with external contact without voltage.
- Multi-language menu.
- Phases sequence control.
- Independent control of the individual compressors.
- Amperometric transformer.
- Cumulative faults block signal.

- Historical alarms function.
- Daily/weekly programming.
- Temperature display of the input and output water.
- Alarms display.
- Integral proportional adjustment of the output water temperature (precision up to $\pm 0.1\text{K}$).
- Programmable timer function.
- Function with double set-point linked to an external contact.
- Fan adjustment.
- Can be interfaced with MODBUS protocol. (Accessory)
- Pump unit check.
- Compressor rotation management.
- “Always Working” Function. In the case of critical conditions (e.g. an environmental temperature that is too high) the machine does not stop but can adjust itself and supply the maximum power in those conditions.
- Self-adapting “Switching Hysteresis” work differential to always ensure the correct functioning times of the compressors even in plants with low water content or insufficient capacities. This system decreases compressor wear.
- AFFP “Anti Freezing Fan Protection” system that periodically switches the fans on when external temperatures are very low.
- PDC “Pull Down Control” system for preventing the activation of the power steps when the temperature of the water quickly approaches the set-point. Optimises machine functioning when working normally and in the presence of load variation, ensuring the best efficiency of the machine in all situations.
- “Compensation of the set-point” on the basis of the external temperature or from external analogue signal (4-20 mA).
- “Demand Limit”: allows to limit electric absorption of the machine in the case of peak loads or generator interventions. Machine absorption can be limited to a specified value by acting on an analogue input from 4 to 20mA: it is useful in the moments of insufficient electric power available from the mains.

Options included, per chiller

- AK acoustic package
- Refrigerant leak detection equipment
- Dual pressure relief valves
- Evaporator trace heater
- Electronic expansion valves
- AER 485 – BMS interface
- Anti vibration mounts ~ supplied loose

Chiller Conformity

The installation and user manual is present inside every appliance, complete with declaration of conformity with reference to the appliance's serial number. The data plate must have the CE mark.

AERMEC, NS series chiller unit mark, is in compliance with the following harmonised standards:

- IEC EN 61000-6-2 and IEC EN 61000-6-4 (Immunity and emission standard for industrial environments);
- EN378 (Refrigerating system and heat pumps - Safety and environmental requirements);
- EN12735 (Copper and copper alloys - Seamless, round copper tubes for air conditioning and refrigeration);
- UNI1285-68 calculation of metal tubes resistance to inside pressure;
- EN60204-1 (Safety of Machinery - Electrical equipment of machines).

They therefore satisfy the essential requisites of the following Directives:

- LVD Directive: 2006/95/CE
- Electromagnetic Compatibility Directive 2004/108/CE
- Machinery Directive 98/37/CE
- PED Directive regarding pressurised equipment 97/23/CE

The product, in agreement with Directive 97/23/CE, satisfies the Total quality Guarantee procedure (form H) with certificate n.06/270-QT3664 Rev.0 issued by the notified body n.1131: CEC, via Pisacane 46, Legnano (MI) - Italy.

FOR THE INSTALLER

1. SELECTION AND PLACE OF INSTALLATION

Before beginning the installation process, decide with the client where the unit is to be installed, whilst paying attention to the following:

- the support surface must withstand the weight of the unit;
- the safe distances (fig.2) between the units and other appliances or structures must be strictly complied with for the inlet and outlet air from the fans to circulate freely.
- The unit must be installed by a qualified technician in compliance with national laws in the country of destination.

2. POSITIONING

The machine is wrapped in estincoil before being dispatched from the factory.

Before handling the unit, verify the lifting capacity of the machines used. After removing the packaging, the unit must be handled by qualified and adequately equipped personnel. To handle the machine:

The unit must be installed by a qualified and suitably trained technician, in compliance with the national legislation in force in the country of destination .

AERMEC will not assume any responsibility for damage due to failure to follow these instructions.

Before beginning any operation, READ THESE INSTRUCTIONS CAREFULLY AND CARRY OUT THE SAFETY CHECKS TO REDUCE ALL RISK OF DANGER TO A MINIMUM. All the personnel involved must have thorough knowledge of the operations and any dangers that may arise at the moment in which the installation operations are carried out.

- hook the lifting belts to the eyebolts (see fig.3).

fasten anti-vibration mounts (AVX accessories) to the holes on the base according to the assembly layout.

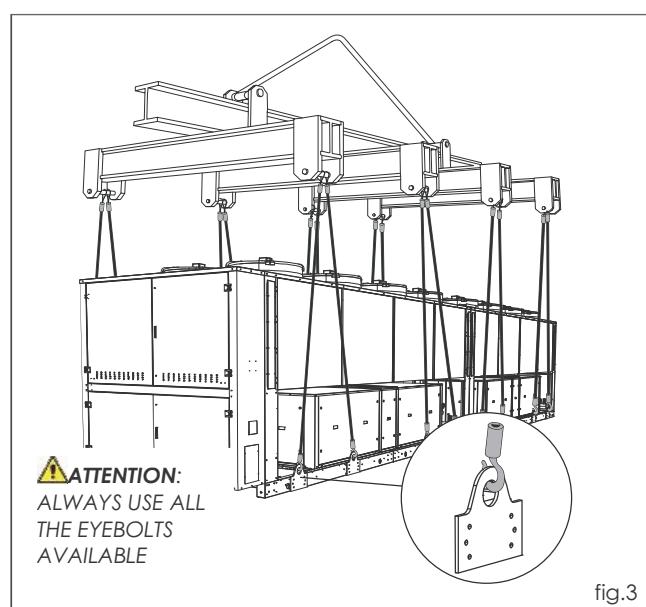

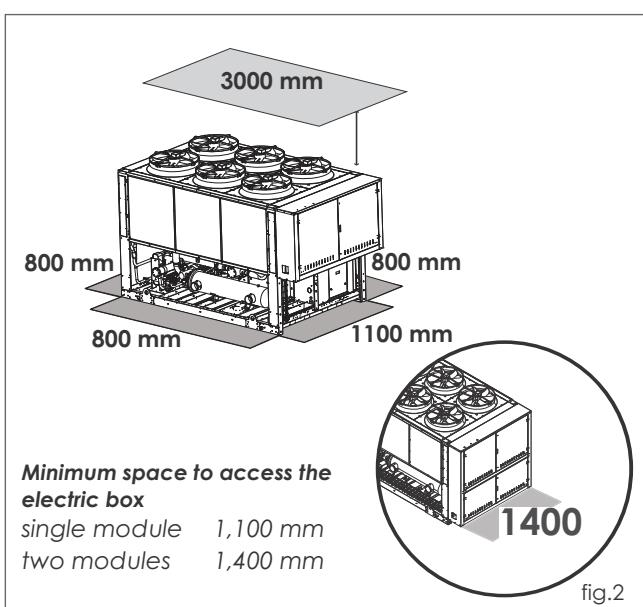

- It is mandatory to foresee the necessary technical space in order to allow ROUTINE AND EXTRAORDINARY MAINTENANCE interventions
- Fasten the unit whilst verifying it is level. Make sure that the hydraulic and electric parts can be easily reached.

ATTENTION: ALWAYS USE ALL THE EYEBOLTS AVAILABLE

- To ensure that the structure of the unit is not damaged, place protections between the lifting belts and the machine. It is strictly prohibited to stand beneath the unit.
- Remember that whilst the chiller is running, it can transmit vibrations; therefore, it is recommended to

2.1. MINIMUM TECHNICAL SPACES (mm)

7.1. ELECTRICAL DATA

The cable sections shown in the table are recommended for maximum lengths of 50m.

For longer lengths or different cable laying, it is up to the PLANNER to calculate the appropriate line switch, the power supply line as well as the connection to the earth wire and connection cables depending on:

- the length
- the type of cable
- the absorption of the unit and the physical location, and the ambient temperature.

ATTENTION

Check the tightening of all power wire clamps on commissioning and after 30 days from start-up. Subsequently, check the tightening of all the power clamps every six months. Loose terminals can cause overheating of the cables and components.

7.2. ELECTRIC POWER CONNECTION TO THE ELECTRICAL MAINS

1. Before connecting the unit to the power supply mains, ensure that the isolating switch is open.
2. Open the front panel.
3. Use the holes for the main electric power supply cable and for the cables of the other external connections

4. under the responsibility of the installer.
5. It is forbidden to access with electric cables in positions not specifically envisioned in this manual.
6. Avoid direct contact with non insulated copper piping and with compressor.
7. Identify the clamps for the electric connection and always refer to the wiring diagram supplied with the unit.
8. For the functional connection of the unit, take the power supply cable to the electric control board inside the unit and connect to clamps L1-L2-L3 and PE respecting the polarities.
9. L1-L2-L3 as phases, and PE as earth (fig.2).
10. Re-position the inspection panels.
11. Ensure that all protections removed for the electric connection have been restored before powering the unit.
12. Place the system master switch (external to the appliance) at "ON" (Fig 1).

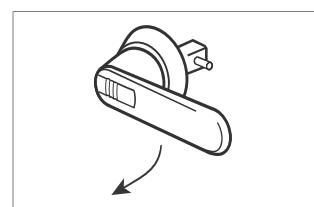

Fig. 1

Fig. 2

ATTENTION

For installation of the **remote control (PRV3)** keep the following in mind:

1. do not exceed the maximum distance, that varies according to the type of accessory (PRV3 = 150 m).

2. place cables away from power cables or cables with diverse pressures that emit electromagnetic disturbances.
3. avoid placing the cable in the vicinity of appliances that can create electromagnetic interferences.
4. the shielded cable should be connected to earthing not subjected to disturbances.
5. The entire length of the cable must be shielded.

8. CONTROL AND COMMISSIONING

8.1. PREPARATION FOR COMMISSIONING

Please note that, on request by the Aermec customer or the legitimate owner of the machine, the units in this series can be started up by the AERMEC After-Sales Service in your area (valid only on Italian territory). The start of operation must be scheduled in advance based on the time frame for the completion of works for the system. Prior to the intervention, all other works (electrical and hydraulic hook-ups, priming and bleeding of air from the system) must have been completed.

8.2. AUXILIARY CONNECTIONS IF ENVISIONED, BY THE INSTALLER

The terminal board connected to the PCO3 board, mounted on the NS-FREECOOLING

units, offers the possibility of connecting the following auxiliary devices (according to the particular unit question):

- Enabling the second set (SET)
- Remote switch-on/off (0/1)
- Multifunction auxiliary exclusion (AMF)
- Season changeover (E/I)
- Recuperator flow meter connection (FLR)
- Connection to control the pump (MPO)
- External peripheral connections (e.g. computers, with a max power supply of 230V50Hz)
- Compressor exclusion (ECP)
- Multifunction input (MULTI IN):
a multifunction input is available where it is possible to select 4 different functions, but only 1 can be set:
 - 1 - 0-10V variable set-point
 - 2 - Max. power requested (0-10V) power from 0 to 100%

3 - Min. power limit (0-10V) power from 0 to 100%

4 - Compensation set-point

-Low pressure switch (BP)

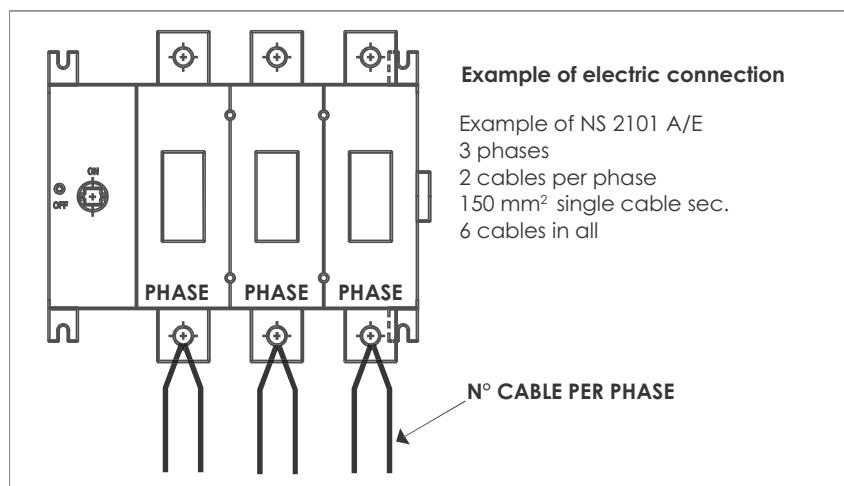

-Evaporator pump circuit breaker protection (TMP)

ATTENTION

Before carrying out the controls indicated below, make sure that the unit is disconnected from the power mains. Make sure that the master switch is locked in the OFF position and an appropriate sign is affixed. Before starting the operations, check that there is no voltage present using a voltmeter or a phase indicator.

8.3. DATA OF ELECTRIC VERSIONS (A/E)

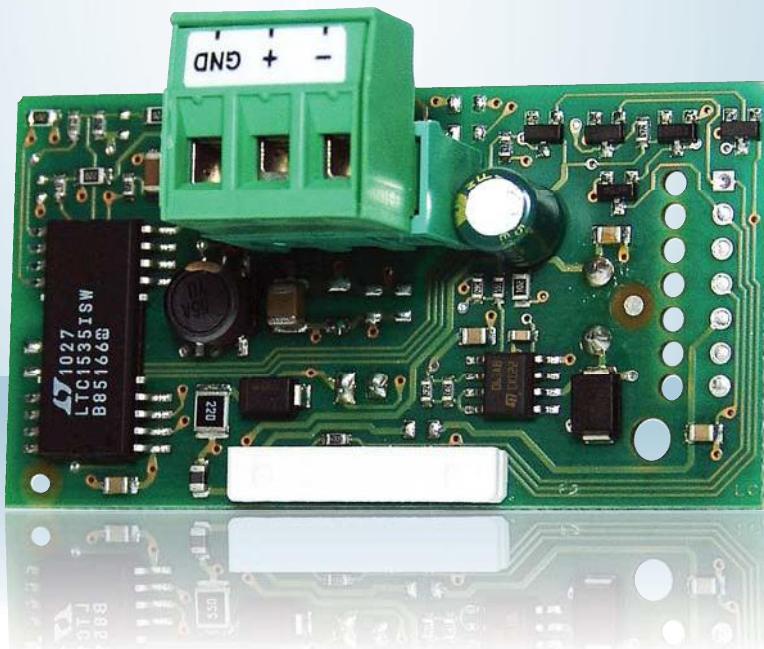

NS	VERSION	n° power supply	Formed by:	SECTION A				SEC B mm ²	Earth mm ²	IL A
				n° cables per phase	single cable sec. mm ²	total n° cables	n° phases			
1251	A - E		1	1	150	3	3	1.5	70	250

AER485P1_6876423_02

Gentile cliente,

La ringraziamo per aver preferito nell'acquisto un prodotto AERMEC. Esso è frutto di pluriennali esperienze e di particolari studi di progettazione, ed è stato costruito con materiali di primissima scelta e con tecnologie avanzatissime.

La marcatura CE, inoltre, garantisce che gli apparecchi rispondano ai requisiti della Direttiva Macchine Europee in materia di sicurezza. Il livello qualitativo è sotto costante sorveglianza, ed i prodotti AERMEC sono pertanto sinonimo di Sicurezza, Qualità e Affidabilità.

I dati possono subire modifiche ritenute necessarie per il miglioramento del prodotto, in qualsiasi momento senza obbligo di preavviso.

Nuovamente grazie.
AERMEC S.p.A

Guida di riferimento per protocollo modaer

Il protocollo di comunicazione Modaer rappresenta lo standard di comunicazione reso disponibile da Aermec per il collegamento tra chiller e sistemi di supervisione o controlli centralizzati (consultare la guida prodotti Aermec per vedere su quali macchine è disponibile questo protocollo). Il protocollo permette il collegamento sia punto a punto (macchina * supervisore), sia di piu' macchine (max 255) su uno stesso bus di collegamento verso un supervisore, in quanto prevede la gestione di un indirizzo per ogni macchina.

La modalità di comunicazione è del tipo master-slave, quindi il sistema di supervisione è master mentre la macchina è slave.

Questo significa che la macchina risponde solamente alle interrogazioni fatte dal supervisore

Configurazione seriale:

- 1200 to 19200 baud
- 1 bit di start
- no parity
- 2 bit di shigh

Codificazione dati:

Ogni parola di 8 bit (1 byte) contenuta nel messaggio è costituita da due caratteri hex codificati con 4 bit ciascuno (0-9, A-F).

Formato del messaggio:

I campi che compongono il messaggio sono riportati in Tabella 1. Il messaggio inizia con un intervallo di silenzio lungo almeno 3,5 caratteri (indicati nella Tabella 1 come tempo di silenzio).

La durata di tale intervallo dipende dal baud rate.

Il primo dato ad essere trasmesso è l'indirizzo della macchina; successivamente il tipo di richiesta (tipo di lettura o di scrittura), i dati relativi alla richiesta, il checksum e infine un intervallo di silenzio della stessa lunghezza di quello iniziale.

Tab. 1

START	tempo di silenzio
INDIRIZZO	1 byte
COMANDO	1 byte
DATO	n x byte
CHECKSUM	2 byte
SHigh	tempo di silenzio

Indirizzo: è l'indirizzo della macchina e può essere compreso tra 1 e 255.

Comando : è l'operazione che si vuole eseguire, l'elenco è in "Tab.2. pagi.2 "

Checksum : è un controllo di sicurezza per verificare la correttezza del dato trasmesso ed è calcolato di volta in volta da chi sta trasmettendo il messaggio: chi lo riceve deve ricalcolarlo e confrontarlo con quello ricevuto per avere la sicurezza che i dati ricevuti sono corretti.

Il checksum viene calcolato considerando tutti i campi tranne il campo checksum e considerando solo gli 8 bit di dati per ogni byte (escludendo bit di start e di shigh).

Il checksum è un dato a 16 bit ed è ottenuto nel modo seguente:

1. settare il dato checksum a 16 bit con tutti 1 (0xffff in hex)
2. eseguire l'exor con il successivo byte del messaggio (partendo dal primo e cioè l'indirizzo)
3. eseguire lo shift di un bit (verso il bit meno significativo) con inserimento di uno 0 sul bit piu' significativo
4. controllo sul bit meno significativo estratto dopo lo shift (bit di carry)
5. se il bit è 1 fare l'exor con il dato fisso hex 0xA001
6. ripetere le operazioni dal punto 3 fino ad effettuare 8 shift
7. ripetere le operazioni dal punto 2 per ogni byte che compone il messaggio.

Tipologia di comandi:

Tab. 2

Comando	Operazione Master
01	Read dati digitali (dati 1 bit)
05	Write dati digitali (dati 1 bit)
03	Read dati analogici (dati 16 bit)
06	Write dati analogici (dati 16 bit)

Formato dei comandi :

Comando 01: Read Dati Digitali

Con questo comando si possono richiedere uno o piu' variabili digitali a partire dall'indirizzo specificato. I dati in risposta vengono raggruppati in byte (8 dati per ogni byte). Il primo byte ricevuto corrisponde agli 8 dati con indirizzo piu' basso, il bit meno significativo di ogni byte corrisponde al dato con indirizzo piu' basso.

ESEMPIO:

RICHIESTA	Campo	hex
Indirizzo macchina	01	
Comando	01	
Indirizzo di partenza (byte high)	00	
Indirizzo di partenza (byte low)	00	
N° di dati (parte high)	00	
N° di dati (parte low)	0A	
Checksum	...	

RISPOSTA	Campo	hex
Indirizzo macchina	01	
Comando	01	
Numero di byte dati in risposta	02	
Dati (0-7)	0E	
Dati (8-9)	03	
Checksum	...	

Comando 05: Write Digitali

Per assegnare 1 ad un indirizzo digitale bisogna trasmettere il dato hex 0xFF00; per assegnare 0 bisogna trasmettere il dato hex 0x0000. Ogni altro tipo di dato viene gestito come errore. La risposta normale è un echo della richiesta se l'assegnazione del dato è andata a buon fine.

ESEMPIO:

RICHIESTA	Campo	hex
Indirizzo macchina	01	
Comando	05	
Indirizzo (byte high)	00	
Indirizzo (byte low)	00	
Dato nuovo (parte high)	FF	
Dato nuovo (parte low)	00	
Checksum	...	

RISPOSTA	Campo	hex
Indirizzo macchina	01	
Comando	05	
Indirizzo (byte high)	00	
Indirizzo (byte low)	00	
Dato nuovo (parte high)	FF	
Dato nuovo (parte low)	00	
Checksum	...	

Comando 03: Read Dati Analogici

Con questo comando si possono richiedere uno o piu' variabili analogiche e intere a partire dall'indirizzo specificato. La codifica adottata è binaria in complemento a 2. Le variabili analogiche vengono rappresentate in decimi (ad esempio il valore 10,0 viene trasmesso come 0064h = 100d), le intere sono trasferite con il valore effettivo (ad esempio 100 viene trasmesso come 0064h = 100d).

Le variabili intere sono quelle con indirizzo maggiore di 128.

Il numero di dati richiesti si intende a partire dall'indirizzo

ESEMPIO:

RICHIESTA	Campo	(hex)
Indirizzo macchina	01	
Comando	03	
Indirizzo di partenza (byte high)	00	
Indirizzo di partenza (byte low)	00	
N° di dati richiesti (parte high)	00	
N° di dati richiesti (parte low)	02	
Checksum	...	

RISPOSTA	Campo	hex
Indirizzo macchina	01	
Comando	03	
Numero di byte dati in risposta	04	
Byte hight dato 0	0C	
Byte low dato 0	03	
Checksum	...	

Comando 06: Write Dati Analogici

Con questo comando si può scrivere una variabile analogica o intera. La codifica adottata è binaria in complemento a 2.

Le variabili analogiche vengono rappresentate in decimi (ad esempio il valore 10,0 viene trasmesso come 0064h = 100d), le intere sono trasferite con il valore effettivo (ad esempio 100 viene trasmesso come 0064h = 100d).

Le variabili intere sono quelle con indirizzo maggiore di 128.

La risposta normale è un echo della richiesta se l'assegnazione del dato è andata a buon fine.

ESEMPIO:

RICHIESTA	Campo	(hex)
Indirizzo macchina	01	
Comando	06	
Indirizzo (byte high)	00	
Indirizzo (byte low)	00	
Dato nuovo (parte high)	1B	
Dato nuovo ((parte low))	00	
Checksum	...	

RISPOSTA	Campo	hex
Indirizzo macchina	01	
Comando	06	
Indirizzo (byte high)	00	
Indirizzo (byte low)	00	
Dato nuovo (parte high)	1B	
Dato nuovo ((parte low))	00	
Checksum	...	

GESTIONE TIMEOUT ED ERRORI DI COMUNICAZIONE

Di seguito si analizzano i possibili casi in cui puo' evolversi la comunicazione e il comportamento previsto dal master e dallo slave come protocollo.

1. Lo slave riceve la richiesta senza errori di comunicazione : slave : risponde come previsto master : deve prevedere un timeout sulla risposta dello slave di almeno 500mS per dare allo slave la possibilità di elaborare i dati.
2. Lo slave non riceve la richiesta per un errore di comunicazione slave : non dà nessuna risposta master : deve prevedere un timeout

sulla risposta

3. Lo slave riceve la richiesta, ma c'è un errore di comunicazione (es. checksum) slave : non dà nessuna risposta master : deve prevedere un timeout sulla risposta
4. Lo slave riceve la richiesta senza errori di comunicazione ma i dati della richiesta non sono corretti (es. comando non previsto, richiesta numero dati eccedente, indirizzi non previsti, valore dato in scrittura fuori range) slave : risponde normalmente con il suo indirizzo sul primo campo, sul campo comando risponde aggiungendo 0x80 al codice del comando e come terzo byte risponde con un codice di errore che identifica l'errore riscontrato. (vedere esempio seguente)

I codici di errore sono i seguenti :

01	Comando non valido
02	Indirizzo dato non valido
03	Valore dato (in modo write) fuori range

ESEMPIO 1

	Errore di comunicazione	RICHIESTA
	Campo	hex
non	Indirizzo macchina	01
	Comando	07 (comando valido)
	Indirizzo macchina	00
	Indirizzo (byte high)	00
	Dato nuovo (parte high)	1B
	Dato nuovo (parte low)	00
	Checksum	...

ESEMPIO 2

	Errore di comunicazione	RISPOSTA
	Campo	hex
ce di errore	Indirizzo macchina	01
comando non valido)	Comando	87
	Codice errore	01 (codi-
	Checksum	...

TABELLE INDIRIZZI

Di seguito vengono illustrati gli indirizzi previsti dal protocollo e il significato corrispondente dal punto di vista della macchina. Gli indirizzi non riportati sono riservati o non utilizzati; pertanto non è consentito utilizzare comandi relativi a indirizzi non riportati in quanto ciò potrebbe comportare malfunzionamenti o rotture della macchina.

Gli indirizzi contrassegnati dal simbolo ✓ sono da utilizzare solamente con la scheda master.

CONFIGURAZIONE di serie della scheda pCO3:

Per configurare la comunicazione seriale della scheda pCO3 con la velocità di trasmissione, l'indirizzo di rete e il tipo di protocollo richiesto, selezionare le seguenti maschere nel menu utente (Prog. chiave):

Indirizzo per le autorità di vigilanza	001
Baudrate9600	(RS485)
Protocollo	Modbus

NOTE RIGUARDANTI LETTURA/SCRITTURA DATI TIMER E STORICO DA SUPERVISORE:

Timer :

Per impostare da Supervisore le seguenti fasce:

Giorno	MARTEDI'
Start Fascia 1	03:15Shigh
Start Fascia 2	14:30
Shigh Fascia 2	20:00

Operazioni da eseguire:

- impostare a '3' la variabile analogica 166 (1=Domenica; 2=Lunedì; ...7=Sabato)
- impostare il valore '3' alla variabile analogica 158
- impostare il valore '15' alla variabile analogica 159
- impostare il valore '12' alla variabile analogica 160
- impostare il valore '30' alla variabile analogica 161
- impostare il valore '14' alla variabile analogica 162
- impostare il valore '30' alla variabile analogica 163
- impostare il valore '10' alla variabile analogica 164
- impostare il valore '00' alla variabile analogica 165
- settare la variabile digitale 74 che memorizza le singole impostazioni.

Viceversa, se l'impostazione fosse stata:

Giorno	MARTEDI'
Start Fascia 1	13:15
Shigh Fascia 1	12:30
Start Fascia 2	14:30
Shigh Fascia 2	20:00

In questo caso la variabile digitale 75 andrà a '1' anche quando:

Io SHigh Fascia 1 e' MINORE dello START Fascia 1;
Io SHigh Fascia 2 e' MINORE dello START Fascia 2;

Io SHigh Fascia 2 e' MINORE dello START Fascia 1.

N.B.: Nel caso in cui si voglia disabilitare una o piu' Fasce e' sufficiente impostare lo START e lo SHigh fascia a 00:00 - 00:00.

STORICO ALLARMI:

Per interrogare da Supervisore lo storico.

Operazioni da eseguire:

- Settare la variabile digitale 79 in modo da ricevere tutte le informazioni su DATA, TEMP. IN, TEMP. OUT,.... riguardo l'ultimo allarme registrato dal PCO3;
- settare la variabile digitale 78 per richiedere dati relativi all'evento di allarme precedente quello visualizzato
- settare la variabile digitale 77 per richiedere dati relativi all'evento di allarme successivo quello visualizzato

A questo punto leggendo le variabili analogiche 32, 33 e da 167 a 172 si ottengono tutte le informazioni relative all'allarme selezionato.

Per resettare lo Storico da Supervisore:

- settare la variabile digitale 76.

REGOLAZIONE ORA

Per regolare l'ora da Supervisore.

Operazioni da eseguire:

- impostare l'ORA nuova sulla variabile analogica 149;
- impostare i MINUTI nuovi sulla variabile analogica 151;
- impostare il GIORNO nuovo sulla variabile analogica 153 (1=Domenica; 2=Lunedì; ...7=Sabato);
- impostare il MESE nuovo sulla variabile analogica 155
- impostare l'ANNO nuovo sulla variabile analogica 157 (2 cifre);
- settare la variabile digitale 56 che copia le variabili appena impostate.

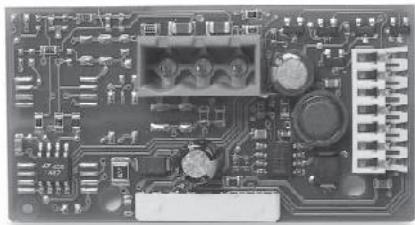

Fig.1

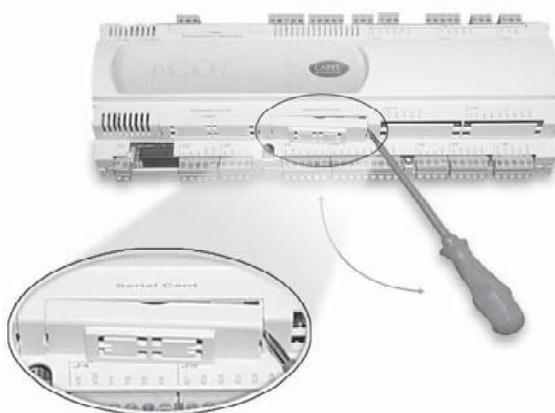

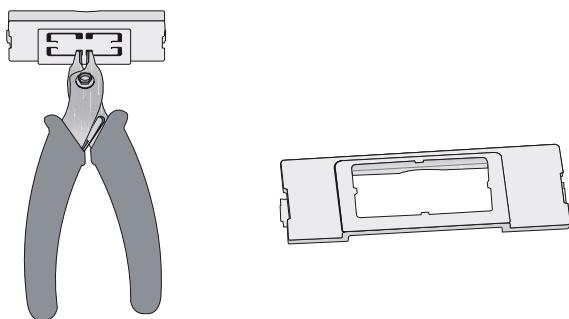

Fig.2

EN

DESCRIPTION

The AER485P1 card is an accessory for the entire PCO3 control series (PCO3B excluded), which allows the direct interface of an RS485 network. The card provides the optical isolation of the controller in relation to the RS485 serial network. The maximum achievable baud rate is 19200 baud (settable via software).

ASSEMBLY

With reference to Figs. 1 ... 4, the connection to the PCO3 is obtained following this procedure:

1. remove the "serial card" of the electronic controller with a screwdriver (see Figure 1);
2. with a pair of nippers, remove the plastic knockout section from the cover, obtaining the opening for the 3-way connector (see Figure 2);
3. insert the optional card into the corresponding comb connector, taking care that the card is correctly inserted and to be in contact with the two plastic supports of the PCO3 container (see Figure 3);
4. close the cover with a screwdriver, lining up the connector of the serial card with the hole on the cover (Fig. 4).

The connection to the RS485 network is obtained using the connector with removable terminals on the card.

The meanings of the pins on the connector (Fig. 5) are indicated by the serigraphy on the card and listed in Fig. 6.

If the card occupies the last position in the serial supervision line, a terminating line resistor with a value of $120\ \Omega$ - $1/4\ W$ is connected to the terminals of pins 2 and 3 as in the diagram of Figure 7.

Technical characteristics

Cable section:	use AWG20/22 twisted two wire shielded cable with a 2 mm sections at the terminals: min. 0.2 - max. 2.5.
Operating conditions:	-10T60 °C; 90 % RH.
Storage conditions:	-20T70 °C; 90 % RH.
Degree of pollution:	normal.
Dimensions (mm)	60x29x20, (60x29: terminal strip, 20: overall width of components).

Warnings. Care in handling the card

Electrical damage may occur on electronic components almost always due to electrostatic discharge caused by the operator. It is therefore necessary take suitable steps for these type of components, in particular:

- before handling any electronic component or card, touch a grounded object (trying to avoid touching a component is not sufficient as a discharge of 10,000 V, which is quite easily achieved by static electricity, produces an arc of about 1 cm);
- the materials must remain in their original packaging as far as possible. If necessary, remove the card from its package and place it in an antistatic bag, without touching the back of the card with the hands;
- the use of plastic, polystyrene or non antistatic bags should be strictly avoided;
- avoid at all cost the direct handling of the card from one operator to another (to avoid electrostatic induction and discharges).

Reference guide for Modaer protocol

The Modaer communication protocol is the communication standard made available by Aermec for the connection between chillers and centralised supervision or control systems (see the Aermec products guide to see on which machine this protocol is available).

The protocol allows both the point to point connection (machine * supervisor), as well as several machines (max 255) on the same bus link to a supervisor, because it manages one address for each machine.

The system uses a master-slave communication mode, therefore the supervision system is master and the machine slave.

This means that the machine only responds to the enquiry made by the supervisor.

Serial configuration:

- 1200 to 19200 baud
- 1 start bit
- no parity
- 2 shigh bits

Data configuration:

Each 8 bit word (1 byte) in the message is comprised of two coded hex characters with 4 bits each (0-9, A-F).

Message format:

The fields that comprise the message are shown in Table 1.

The message begins with a dead interval of at least 3.5 characters long (indicated in Table 1 as a dead period).

The duration of this interval depends on the baud rate.

The first data to be transmitted is the address of the machine; then the type of request (read or write type), data relating to the request, the checksum and then a dead interval with the same length as that at the beginning .

Tab.1

START	dead time
ADDRESS	1 byte
COMMAND	1 byte
DATA	n x byte
CHECKSUM	2 bytes
SHigh	dead time

Address: this is the machine address and can be comprised between 1 and 255.

Command: this is the operation you want to perform, the list is in "Tab.2. page 2 "

Checksum: this is a safety check to verify the correctness of the data being transmitted and is calculated from time to time by the sender of the message; the receiver has to recalculate and compare it with the one received in order to be sure that all information received is correct.

The checksum is calculated by considering all areas except the checksum field and considering only the 8 bits of data for each byte (excluding start and shigh bits).

The checksum is a 16-bit data and is obtained as follows:

1. set the 16 bit checksum data with all 1 (0xffff in hex)
2. run the Exor with the next byte of the message (starting from the first, i.e. the address)
3. run the shift of a bit (toward the least significant bit) by inserting a 0 on the more significant bit
4. control on the least significant bit extracted after the shift (carry bit)
5. if the bit is 1 perform the exor with the fixed data hex 0xA001
6. repeat the operations from point 3 until 8 shifts have been made
7. repeat the operations from point 2 for each byte that comprises the message.

- The slave receives the request, but there is a slave communication error (e.g. checksum): no master reply is given: there should be a timeout on the response
- The slave receives the request without communication errors but the data of the request are incorrect (e.g. command not expected, excess data number request, address not provided, the written value given out of range) slave: normally responds with its address on the first field, responds on the command field by adding 0x80 to the command code and as the third byte responds with an error code that identifies the error found. (see following example)

The error codes are as follows:

01	Invalid command
02	Invalid data address
03	Data value (in write mode) out of range

EXAMPLE 1

Communication error Hex field	REQUEST
Machine address	01
Command	07 (invalid com-
mand)	
Machine address	00
Address (byte high)	00
New data (high part)	1B
New data (low part)	00
Checksum	...

EXAMPLE 2

Communication error Hex field	REPLY
Machine address	01
Command	87
Error code	01 (invalid com-
mand)	
Checksum	error code)
	...

FAMILIES: RV - NW - NS - NSB - WS - WF

TABLE OF ADDRESSES

Below are the addresses foreseen by the protocol and the corresponding meaning in terms of the machine.
Addresses not indicated are reserved or unused; therefore the use of commands related to addresses not listed are not permitted as this could lead to malfunctions or failures of the machine.

Addresses marked by ✓ are for use with the master card only.

SERIAL CONFIGURATION OF THE PCO3 CARD:

To configure the serial communication of the PCO³ card with the Baud rate, the network address and the type of protocol required, select the following masks in the user menu (Prog. key):

Address for supervisor	001
Baud rate 9600	(RS485 only)
Protocol	Modbus

NOTES CONCERNING READ/WRITE OF SUPERVISOR TIMER AND LOG DATA :

Timer :

To set the following slots from the supervisor:

Day	TUESDAY
Start Slot 1	03:15 Shigh Slot 1 12:30
Start Slot 2	14:30
Shigh Slot 2	20:00

Operations to perform:

- set the analogue variable 166 to '3' (1=Sunday; 2=Monday; ... 7=Saturday)
- set the value '3' to the analogue variable 158
- set the value '15' to the analogue variable 159
- set the value '12' to the analogue variable 160
- set the value '30' to the analogue variable 161
- set the value '14' to the analogue variable 162
- set the value '30' to the analogue variable 163
- set the value '10' to the analogue variable 164
- set the value '00' to the analogue variable 165
- set the digital variable 74 that save the individual settings.

Vice versa, if the setting has been made:

Day	TUESDAY
Start Slot 1	13:15
Shigh Slot 1	12:30
Start Slot 2	14:30
Shigh Slot 2	20:00

In this case the digital variable 75 will go to '1' even when:
SHigh Slot 1 is LESS than the START Slot 1;
SHigh Slot 2 is LESS than the START Slot 2;
SHigh Slot 2 is LESS than the START Slot 1.

N.B.: In case one or more 'Slots need to be disabled simply set the START and SHigh slot to 00:00 - 00:00.

ALARMS LOG:

To interrogate the Log from the Supervisor.

Operations to perform:

- Set the digital variable 79 to receive all DATE, IN TEMP, OUT TEMP, information,..... concerning the last alarm recorded by the PCO3;
- set the digital variable 78 to request data concerning the alarm prior to that displayed;
- set the digital variable 77 to request data concerning the alarm after that displayed.

At this point, reading the analogue variables 32, 33 and from 167 to 172, all the alarm information relating to the alarm selected is obtained.

To reset the Log from the Supervisor.

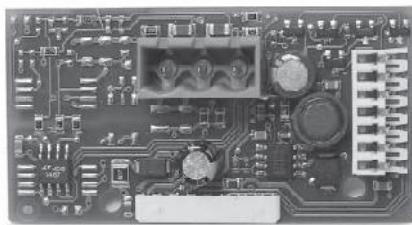

- set the digital variable 76.

HOUR ADJUSTMENT

To adjust the hour from the Supervisor.

Operations to perform:

- set the new HOUR on the analogue variable 149;
- set the new MINUTES on the analogue variable 151;
- set the new DAY on the analogue variable 153 (1=Sunday; 2=Monday; ... 7=Saturday);
- set the new MONTH on the analogue variable 155
- set the new YEAR on the analogue variable 157 (2 digits);
- set the digital variable 56 that copies the variables just set.

DESCRIPTION

La carte AER485P1 est un accessoire de toute la famille de contrôles PCO3 (sauf PCO3B) qui permet l'interface directe à un réseau RS485. La carte garantit l'opto-isolation du contrôleur par rapport au réseau serial RS485. Le baud rate maximum qui peut être obtenu est 19 200 baud (réglable à l'aide du logiciel).

MONTAGE

Pour les Figures 1...4, la connexion au PCO3 se fait en suivant cette procédure :

1. avec un tournevis, ôter le cache "serialcard" du contrôle électrique (voir fig. 1) ;
2. avec un ciseau, éliminer la partie pré-coupée en plastique du cache, de manière à obtenir le trou correspondant à la sortie à 3 voies (voir Figure 2) ;
3. introduire la carte optionnelle dans le connecteur peigne correspondant en veillant à ce que la carte soit correctement insérée et qu'elle bute contre les deux appuis en plastique faisant partie du boîtier du PCO3 (voir figure 3) ;
4. refermer le cache avec le tournevis en faisant coïncider le connecteur exposé de la carte série avec le trou qui a été fait sur le cache (voir figure 4).

La connexion au réseau RS485 s'obtient par l'intermédiaire du connecteur à bornes extractibles qui se trouve sur la carte.

Les sens de pins sur ce connecteur (Fig. 5) sont mis en évidence par la sérigraphie qui se trouvent sur la carte et énumérés à la figure 6.

Si la carte occupe la dernière position dans la ligne série de supervision, aux extrémités des pins 2 et 3, il faut brancher une résistance de fermeture de ligne, de la valeur de $120\ \Omega - 1/4\ W$ comme d'après le schéma de la Figure 7

Caractéristiques techniques

Section du câble :	utiliser un câble retard et blindé à deux fils AWG20/22 avec une section, aux bornes de mm 2 : min. 0,2 - max. 2,5.
Conditions de fonctionnement :	-10 T60 °C ; 90 % HR
Conditions d'entreposage :	-20T70 °C ; 90 % HR
Degré de pollution :	normal.
Dimensions (mm) :	60x29x20, (60x29 : plaque à bornes, 20 : largeur composants hors tout).

Avertissements. Précautions pour manipuler la carte

Les inconvénients électriques qui se vérifient sur les composants électroniques arrivent presque tous à cause des décharges électrostatiques provoquées par l'opérateur. Il est donc nécessaire de prendre des mesures adéquates pour que ces catégories de composants, et notamment :

- avant de manipuler tout composant électronique ou carte, toucher une mise à terre (le fait même d'éviter de toucher un composant n'est pas suffisant car une décharge de 10000 V, tension très facile à atteindre avec l'électricité statique, provoque un arc d'environ 1 cm) ;
- Les matériaux doivent rester autant que possible dans leurs emballages d'origine. Si nécessaire, prélever la carte de son conditionnement et placer le produit dans un emballage antistatique sans toucher le verso de la carte avec les mains ;
- éviter absolument d'utiliser des sachets en plastique, polystyrène ou des éponges non antistatiques ;
- éviter absolument le passage direct entre opérateurs (pour éviter des phénomènes d'induction électrostatique et les décharges correspondantes).

Guide de référence pour protocole modae

Le protocole de communication Modae représente le standard de communication réseau Aermec pour la connexion entre chillers et les systèmes de supervision ou contrôle centralisés (consulter le catalogue de produits Aermec pour savoir quels appareils acceptent ce protocole). Le protocole permet la connexion point à point (appareil * superviseur) de plusieurs appareils (max. 255) sur un même bus de liaison vers un superviseur, car il prévoit la gestion d'une adresse pour chaque appareil. Le mode de communication est de type master-slave, le système de supervision fonctionnant en master, l'appareil en slave. Cela signifie que l'appareil répond seulement aux requêtes du superviseur.

Configuration série :

- 1200 to 19200 baud
- 1 bit de départ
- aucune parité
- 2 bit d'arrêt

Codification données :

Chaque mot de 8 bits (1 octet) contenu dans le message est constitué de deux caractères hex codifiés avec 4 bits chacun (0-9, A-F).

Format du message :

Les champs qui composent le message sont indiqués dans le Tableau 1. Le message commence par un intervalle de silence d'au moins 3,5 caractères (indiqués dans le Tableau 1 comme temps de silence). La durée de cet intervalle dépend du baud rate.

La première donnée transmise est l'adresse de la machine ; ensuite le type de demande (type de lecture ou d'écriture), les données relatives à la demande, le checksum et enfin un intervalle de silence de la même longueur que celui initiale .

Tab.1

START	temps de silence
ADRESSE	1 byte
COMMANDE	1 byte
DONNEE	n x octet
CHECKSUM ...	2 byte
SHigh	temps de silence

Adresse : est l'adresse de la machine et peut être comprise entre 1 et 255.

Commande est l'opération que l'on veut exécuter, la liste est en "Tab. 2. page 2"

Checksum : est un contrôle de sécurité pour vérifier la justesse de la donnée transmise et est calculé chaque fois que le message est transmis ; qui le reçoit doit le recalculer et le comparer avec celui reçu pour être sûr que les données reçues soient correctes.

Le checksum est calculé en considérant tous les champs sauf le champ checksum et en considérant seulement les 8 bits de données pour chaque octet (en excluant le bit de start et de shigh).

Le checksum est une donnée de 16 bits et est obtenu comme suit :

1. régler la donnée checksum à 16 bits avec tous 1 (0xffff in hex)
2. exécuter l'exor avec le octet du message successif (en partant du premier c'est-à-dire de l'adresse)
3. exécuter le shift d'un bit (vers le bit moins significatif) avec insertion d'un 0 sur le bit plus significatif
4. contrôle sur le bit le moins significatif extrait après le shift (bit di carry)
5. si le bit est 1 faire l'exor avec la donnée fixe hex 0xA001
6. répéter les opérations du point 3 jusqu'à effectuer 8 shift
7. répéter les opérations du point 2 pour chaque octet qui compose le message.

Typologie de commandes :

Tab.2

Commande	Opération
Master	
01	Lecture données numériques (données 1 bit)
05	Écriture données numériques (données 1 bit)
03	Lecture données numériques (données 16 bit)
06	Écriture données numériques (données 16 bit)

Format des commandes :

Commande 01 : Lectures Données Numériques

Avec cette commande l'on peut demander une ou plusieurs variables numériques à partir de l'adresse spécifiée. Les données en réponse sont regroupées en octet (8 données par octet).

Le premier octet reçu correspond aux 8 données avec l'adresse la plus basse, le bit le moins significatif de chaque octet correspond à la donnée avec l'adresse la plus basse.

EXEMPLE :

DEMANDE		
Champ	hex	
Adresse machine	01	
Commande	01	
Adresse de départ (byte high)	00	
Adresse de départ (byte low)	00	
N° de données (partie high)	00	
N° de données (partie low)	0A	
Checksum	...	
REPONSE		
Champ	hex	
Adresse machine	01	
Commande	03	
Numéro de octets donnés en réponse	04	
Octet high donné 0	0C	
octet low donné 0	03	
Checksum	...	

Commande 05 : Écritures Numériques

Pour attribuer 1 à une adresse numérique il faut transmettre la donnée hex 0xFF00 ;

pour attribuer 0 il faut transmettre la donnée hex 0x0000.

Tout autre type de donnée est gérée comme erreur.

La réponse normale est un écho de la réponse si l'attribution de la donnée est allée à bonne fin.

EXEMPLE :

DEMANDE		
Champ	hex	
Adresse machine	01	
Commande	05	
Adresse (byte high)	00	
Adresse (byte low)	00	
Nouvelle donnée (partie high)	FF	
Nouvelle donnée (partie low)	00	
Checksum	...	
REPONSE		
Champ	hex	
Adresse machine	01	
Commande	05	
Adresse (byte high)	00	
Adresse (byte low)	00	
Nouvelle donnée (partie high)	1B	
Nouvelle donnée (partie low)	00	
Checksum	...	

Commande 03 : Lectures Données Analogiques

Avec cette commande l'on peut demander une ou plusieurs variables analogiques et entières à partir de l'adresse spécifiée. L'encodage adopté est binaire en complément à 2. Les variables analogiques sont représentées en dixièmes (par exemple la valeur 10,0 est transmise comme 0064h = 100d), les entières sont transférées avec la valeur effective (par exemple 100 est transmis comme 0064h = 100d).

Les variables entières sont celles avec l'adresse supérieure à 128.

Le nombre de données demandées s'entend à partir de l'adresse

EXEMPLE :

DEMANDE		(hex)
Champ		
Adresse machine	01	
Commande	03	
Adresse de départ (byte high)	00	
Adresse de départ (byte low)	00	
N° de données demandées (partie high)	00	
N° de données demandées (partie low)	02	
Checksum	...	
REPONSE		
Champ	hex	
Adresse machine	01	
Commande	03	
Numéro de octets donnés en réponse	04	
Octet high donné 0	0C	
octet low donné 0	03	
Checksum	...	

Commande 06 : Écritures Données Analogiques

Avec cette commande l'on peut écrire une variable analogique ou entière. L'encodage adopté est binaire en complément à 2.

Les variables analogiques sont représentées en dixièmes (par exemple la valeur 10,0 est transmise comme 0064h = 100d), les entières sont transférées avec la valeur effective (par exemple 100 est transmis comme 0064h = 100d).

Les variables entières sont celles avec l'adresse supérieure à 128.

La réponse normale est un écho de la réponse si l'attribution de la donnée est allée à bonne fin.

EXEMPLE :

DEMANDE		(hex)
Champ		
Adresse machine	01	
Commande	06	
Adresse (byte high)	00	
Adresse (byte low)	00	
Nouvelle donnée (partie high)	1B

Adresse (byte high)	00	
Adresse (byte low)	00	
Nouvelle donnée (partie high)	1B	
Nouvelle donnée (partie low)	00	
Checksum	...	

GESTION TEMPORISATION ET ERREURS DE COMMUNICATION

Ci-après sont analysés les cas possibles où la communication peut évoluer ainsi que le comportement prévu de master et de slave comme protocole.

1. Le slave reçoit la demande sans erreurs de communication : slave : répond comme prévu master : doit prévoir une temporisation sur la réponse du slave d'au moins 500mS pour donner au slave la possibilité d'élaborer les données.
2. Le slave ne reçoit pas la demande pour une erreur de communication slave : il ne donne aucune réponse master : il doit prévoir une temporisation sur la réponse.

- Le slave reçoit la demande, mais il y a une erreur de communication (ex. checksum) slave : il ne donne aucune réponse master : il doit prévoir une température sur la réponse
- Le slave reçoit la demande sans erreurs de communication mais les données de réponse ne sont pas correctes (ex. commande non prévue, demande nombre de données excédante, adresses non prévues, valeur données en écriture hors gamme) slave : il répond normalement avec son adresse sur le premier champ, sur le champ commande il répond en ajoutant 0x80 au code de la commande et comme troisième octet il répond avec un code d'erreur qui identifie l'erreur. (voir exemple suivant)

Les codes d'erreur sont les suivants :

01	Commande non valide
02	Adresse donnée non valide
03	Valeur donnée (en mode écriture) hors gamme

EXEMPLE 1

	Erreurs de communication Champ	DEMANDE hex
non	Adresse machine Commande	01 07 (commande valide)
	Adresse machine	00
	Adresse (byte high)	00
	Nouvelle donnée (partie high)	1B
	Nouvelle donnée (partie low)	00
	Checksum	...

EXEMPLE 2

	Erreurs de communication Champ	RÉPONSE hex
valide)	Adresse machine	01
	Commande	87
	Code erreur	01 (code d'erreur commande non
	Checksum	...

FAMILLE: RV - NW - NS - NSB - WS - WF

TABLEAUX ADRESSES

Ci-après sont indiquées les adresses prévues par le protocole et la signification correspondante du point de vue de l'appareil. Les adresses non reportées sont réservées ou non utilisées ; par conséquent il n'est pas permis d'utiliser de commandes relatives à des adresses non indiquées car cela pourrait provoquer de mauvais fonctionnements ou des ruptures de la machine.

Les adresses identifiées par le symbole ✓ sont à utiliser seulement avec la carte master.

CONFIGURATION SÉRIELLE DE LA CARTE PCO3 :

Pour configurer la communication sérielle de la carte PCO³ avec le Baud rate, l'adresse de réseau et le type de protocole voulu sélectionner les masques suivants du menu utilisateur (touche Prog.) :

Address for supervisor	001
Baud rate9600	(RS485 only)
Protocol	Modbus

REMARQUES CONCERNANT LA LECTURE/ÉCRITURE DONNÉES TEMPORISATEUR ET HISTORIQUE DE SUPERVISEUR :

Temporisateur :

Pour régler du Superviseur les tranches suivantes:

Jour	MARDI
Start Tranche 1	03:15
Start Tranche 2	14:30
Shigh Tranche 2	20:00

Opérations à effectuer :

- régler sur '3' la variable analogique 166 (1=Dimanche ; 2=Lundi ; ... 7=Samedi)
- Régler la valeur '3' à la variable analogique 158
- Régler la valeur '15' à la variable analogique 159
- Régler la valeur '12' à la variable analogique 160
- Régler la valeur '30' à la variable analogique 161
- Régler la valeur '14' à la variable analogique 162
- Régler la valeur '30' à la variable analogique 163
- Régler la valeur '10' à la variable analogique 164
- Régler la valeur '00' à la variable analogique 165
- régler la variable numérique 74 qui mémorise chaque réglage.

Vice-versa, si le réglage avait été :

Jour	MARDI'
Start Tranche 1	13:15
Shigh Tranche 1	12:30
Start Tranche 2	14:30
Shigh Tranche 2	20:00

Dans ce cas la variable numérique 75 ira à '1' même quand : le SHigh Tranche 1 est INFÉRIEUR au START Tranche 1 ; le SHigh Tranche 2 est INFÉRIEUR au START Tranche 2 ; le SHigh Tranche 2 est INFÉRIEUR au START Tranche 1 ;

N.B.: Si l'on veut désactiver une ou plusieurs Tranches il suffit de régler le START et le SHigh tranche sur 00:00 - 00:00.

HISTORIQUE DES ALARMES :

Pour interroger l'historique du Superviseur.

Opérations à effectuer :

- Régler la variable numérique 79 afin de recevoir toutes les informations sur DATE, TEMP. IN, TEMP. OUT,.... concernant la dernière alarme enregistrée du PCO3 ;
- régler la variable numérique 78 pour demander des données relatives à l'événement d'alarme précédent celui affiché
- régler la variable numérique 77 pour demander des données relatives à l'événement d'alarme précédent celui affiché

Maintenant en lisant les variables analogiques 32, 33 et de 167 à 172 l'on obtient toutes les informations relatives à l'alarme sélectionnée.

Pour réarmer l'Historique du Superviseur :

- régler la variable numérique 76

RÉGLAGE HEURE

Pour régler l'heure du Superviseur.

Opérations à effectuer :

- régler la nouvelle HEURE sur la variable analogique 149 ;
- régler les nouvelles MINUTES sur la variable analogique 151 ;
- régler le nouveau JOUR sur la variable analogique 153 (1=Dimanche ; 2=Lundi ; ... 7=Samedi) ;
- régler le nouveau MOIS sur la variable analogique 155 ;
- régler la nouvelle ANNÉE sur la variable analogique 157 (2 chiffres) ;
- régler la variable numérique 56 qui copie les variables à peine réglées.

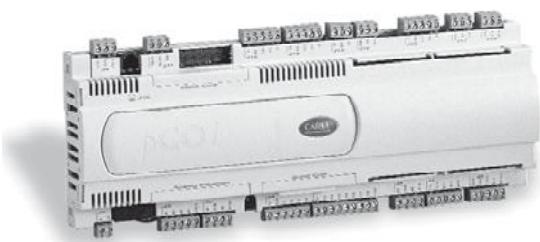

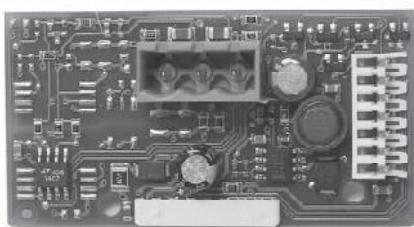

Abb. 1

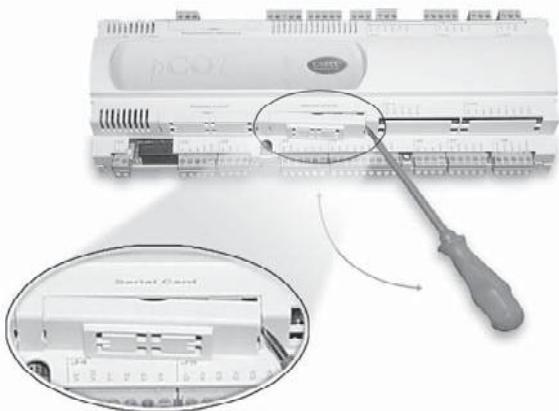

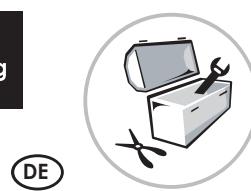

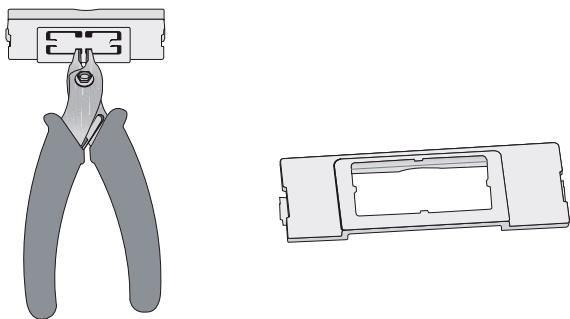

Abb. 2

BESCHREIBUNG

Die Platine AER485P1 ist ein Zubehörteil und gehört zur Familie der PCO3 (ausgenommen PCO3B) Kontrollen, sie dient als direkte Schnittstellenverbindung zu einem RS485 Netz. Die Platine gewährleistet die Optoisolierung des Controllers hinsichtlich des seriellen Netzes RS485. Die maximale erzielbare Baudrate beträgt 19 200 baud (einstellbar über die Software).

MONTAGE

Unter Bezugnahme auf die Abb. 1...4, erfolgt der Anschluss an die Steuerkarte PCO3 wie folgt:

1. die Klappe "Serialcard" des elektronischen Controllers mit einem Schraubendreher abnehmen (siehe Abb. 1);
2. den perforierten Kunststoffteil der Klappe mit einer Trennschere entfernen, wodurch eine Öffnung übereinstimmend mit dem Ausgang des 3-fach Steckverbinder entsteht (siehe Abb. 2);
3. die als Zubehör erhältliche Platine in den dementsprechenden Kammverbinder stecken, darauf achten, dass sie gut steckt und an den beiden Kunststoffstützen am Behälter der Platine PCO3 gut aufsitzt (siehe Abb. 3);
4. die Klappe mithilfe eines Schraubendrehers wieder so schließen, dass der frei liegende Verbinder der seriellen Platine mit der Öffnung an der Klappe übereinstimmt (siehe Abb. 4).

Der Anschluss an das RS485-Netz erfolgt über den an der Platine vorhandenen Steckverbinder mit abnehmbaren Klemmen.

Die Bedeutungen der Stifte auf diesem Steckverbinder (Abb. 5) sind am Siebdruck auf der Platine erkennbar und werden in Abb. 6 aufgelistet. Sollte die Platine die letzte Position in der seriellen Überwachungsleitung einnehmen, wird an die Endstücke der Stifte 2 und 3 ein Leitungsabschlusswiderstand mit einem Wert von $120\ \Omega$ - $1/4\ W$ angeschlossen, wie im Plan aus Abb. 7 ersichtlich.

Technische Eigenschaften

Kabelquerschnitt:	ein gedrehtes und geschirmtes 2-drahtiges Kabel AWG20/22 mit Querschnitten an den Klemmen zwischen min. 0,2 und max. 2,5 mm ² verwenden.
Betriebsbedingungen: Lagerungs- bedingungen:	-10T60 °C; 90 % RF -20T70 °C; 90 % RF
Verschmutzungsgrad:	normal.
Abmessungen (mm):	60x29x20, (60x29: Socket, 20: größte Außenbreite der Bauteile).

Hinweise. Vorsicht bei der Handhabung der Platine

Die elektrischen Beschädigungen an den elektronischen Bauteilen erfolgen fast immer durch elektrostatische Entladungen, ausgelöst durch den Bediener. Bei diesen Kategorien von Bauteilen ist daher entsprechende Vorsicht geboten, insbesondere:

- bevor man einen elektronischen Bauteil oder die Platine angreift, muss Masse berührt werden (die Absicht einen elektronischen Bauteil nicht berühren zu wollen alleine reicht nicht aus, da eine Entladung von 10000 V, eine Spannung, die mit der statischen Elektrizität sehr leicht erreicht wird, bewirkt einen ca. 1 cm großen Spannungsbogen);
- die Materialien müssen so weit wie möglich in ihren Originalverpackungen verbleiben. Ggf. die Platine aus einer Verpackung nehmen und das Produkt in eine antistatische Verpackung geben, ohne die Rückseite der Platine mit den Händen zu berühren;
- die Verwendung von Plastiksäcken, Polystyrol oder nicht antistatischen Schwämmen ist strikt zu vermeiden;
- die direkte Übergabe der Platine zwischen Bedienern ist absolut zu vermeiden (zur Vermeidung von elektrostatischer Induktion und daraus resultierende Entladungen).

Anleitung zum Modaer-Protokoll

Das Kommunikationsprotokoll Modaer ist die von Aermec bereitgestellte Standardkommunikation für die Verbindung zwischen Kaltwassersätzen und zentralgesteuerten Überwachungs- oder Steuerungssystemen (zur Feststellung auf welchen Maschinen dieses Protokoll verfügbar ist, verweisen wir auf den Aermec-Produkt-Katalog).

Durch die Verwaltung von einer Adresse pro Maschine ermöglicht das Protokoll sowohl die Punkt-zu-Punkt Verbindung (Maschine * Überwachungssystem) als auch die Verbindung mehrerer Maschinen (max. 255) über denselben Verbindungsbus zu einem Überwachungssystem.

Der Kommunikationsmodus entspricht dem Typ Master-Slave, das Überwachungssystem ist also der Master, die Maschine ist der Slave.

Das bedeutet, dass die Maschine nur auf Anfragen des Überwachungssystems reagiert

Konfiguration der seriellen Schnittstelle:

- 1200 bis 19200 Baud
- 1 Start-Bit
- no parity
- 2 Shighp-Bit

Datencodierung:

Jedes in der Meldung enthaltene 8-Bit-Datenwort (1 Byte) besteht aus 2 kodierten Hex-Zeichen mit je 4 Bit (0-9, A-F).

Meldungsformat:

Die Felder, aus denen die Meldung besteht, sind in Tabelle 1 angeführt. Die Meldung beginnt mit einer mindestens 3,5 Zeichen langen Ruhezeit (in der Tabelle 1 als Ruhezeit angegeben).

Die Dauer dieser Ruhezeit hängt von der Baudrate ab.

Als erstes wird die Maschinenadresse übertragen; danach der Anfragetyp (Lese- oder Schreibtyp), die die Anfrage betreffenden Daten, die Prüfsumme und schließlich eine Ruhezeit in derselben Länge wie am Anfang.

Tab.1

START	Ruhezeit
ADRESSE	1 Byte
BEFEHL	1 Byte
WERT	n x Byte
PRÜFSUMME	2 Byte
SHIGHP	Ruhezeit

Adresse:	Maschinenadresse, die zwischen 1 und 255 liegen kann.
----------	---

Befehl :	Schritt, den man ausführen möchte, die Aufstellung finden Sie in "Tab.2. Seite 2 "
----------	--

Prüfsumme :	Sicherheitskontrolle zur Überprüfung ob der Datenwert ordnungsgemäß übertragen wurde, sie wird jedes Mal vom Meldungssender neu kalkuliert; um sicherzustellen, dass die empfangenen Daten korrekt sind, muss der Empfänger den Datenwert nochmals berechnen und mit dem erhaltenen vergleichen.
-------------	--

Bei der Berechnung der Prüfsumme werden alle Felder berücksichtigt mit Ausnahme des Prüfsummenfelds und es werden nur die 8 Bit-Daten pro Byte berücksichtigt (Start- und Shighpbit werden nicht berücksichtigt). Die Prüfsumme ist ein 16-Bit-Wert und wird wie folgt ermittelt:

1. den 16-Bit Prüfsummenwert ausschließlich mit 1 einstellen (0xffff in Hex)
2. Exor mit dem darauf folgenden Meldungsbyte ausführen (ausgehend vom ersten, also der Maschinenadresse)
3. Verschiebung eines Bits (zum niederwertigen Bit hin) mit der Eingabe einer 0 am höherwertigen Bit
4. Kontrolle am nach dem Shift erhaltenen niedlerwertigen Bit (Übertragungsbit)
5. Ist das Bit gleich 1, Exor mit dem festen Datenwert hex 0xA001 ausführen
6. Die Schritte ab Punkt 3 wiederholen, bis 8 Verschiebungen durchgeführt wurden
7. Für jedes Byte, aus dem die Meldung besteht, die Schritte ab Punkt 2 durchführen.

Typologie der Befehle:

Tab.2

Steuerung	Maßnahme
	Master
01	Read digitale Daten (1-Bit-Daten)
05	Write digitale Daten (1-Bit-Daten)
03	Read analoge Daten (16-Bit-Daten)
06	Write analoge Daten (16-Bit-Daten)

Befehlsformat :

Befehl 01: Read Digitale Daten

Beginnend mit der spezifischen Adresse können mit diesem Befehl können eine oder mehrere digitale Variablen angefragt werden. Die Antwort-Daten werden in Bytes zusammengefasst (8 Daten pro Byte).

Das erste empfangene Byte entspricht den 8 Daten mit niedrigerer Adresse, das niederwertige Bit eines jeden Bytes entspricht dem Datenwert mit niedrigerer Adresse.

BEISPIEL:

ANFRAGE		
Feld		hex
Maschinenadresse	01	
Befehl	01	
Start-Adresse (Byte high)	00	
Start-Adresse (Byte low)	00

TIMEOUT-VERWALTUNG UND KOMMUNIKATIONSFEHLER

Im Folgenden werden die verschiedenen Möglichkeiten des Kommunikationsverlaufes und die vorgesehenen Reaktionen von Master und Slave als Protokoll analysiert.

- Der Slave empfängt die Anfrage ohne Kommunikationsfehler:
Slave: antwortet wie vorgesehen Master : muss ein Timeout für die Antwort des Slave von min. 500 ms einberechnen, um dem Slave die Möglichkeit der Datenverarbeitung zu geben.
- Wegen eines Kommunikationsfehlers empfängt der Slave die Anfrage nicht: er gibt keine Antwort Master : muss ein Timeout für die Antwort einberechnen

- Der Slave empfängt die Anfrage, aber es liegt ein Kommunikationsfehler vor (z.B. Prüfsumme) Slave : gibt keine Antwort Master : muss ein Timeout für die Antwort einberechnen
- Der Slave empfängt die Anfrage ohne Kommunikationsfehler, aber die Anfragedaten sind nicht korrekt (z.B. nicht vorgesehener Befehl, Anfrage der Datenanzahl zu hoch, Adressen nicht vorgesehen, Write-Datenwert außerhalb der Bandbreite) Slave : antwortet normal mit eigener Adresse auf dem ersten Feld, auf dem Befehlsfeld antwortet er durch Hinzufügen von 0x80 an den Befehlscode, und als drittes Byte antwortet er mit Fehlercode, der den aufgetretenen Fehler identifiziert. (siehe folgendes Beispiel)

Die Fehlercodes lauten :

- | | |
|----|--|
| 01 | Ungültiger Befehl |
| 02 | Ungültige Datenadresse |
| 03 | Datenwert (im Write-Modus)
außerhalb der Bandbreite |

BEISPIEL 1:

	Kommunikationsfehler Feld	ANFRAGE hex	
Befehl)	Maschinenadresse Befehl	01	
		07 (ungültiger	
	Maschinenadresse	00	
	Adresse (byte high)	00	
	Neuer Wert (Bereich high)	1B	
	Neuer Wert (Bereich low)	00	
	Checksum	...	

BEISPIEL 2

	Kommunikationsfehler Feld	ANTWORT hex	
	Maschinenadresse	01	
	Befehl	87	
	Fehlercode	01 (Fehlercode ungültiger Befehl)	
	Checksum	...	

FAMILIEN: RV - NW - NS - NSB - WS - WF

ADRESSTABellen

Nachstehend werden die vom Protokoll vorgesehenen Adressen und ihre Bedeutung aus der Maschinensicht dargestellt. Die nicht aufgeführten Adressen sind reserviert oder nicht verwendet; es ist daher unzulässig, Befehle von nicht aufgeführten Adressen zu verwenden. Dies könnte zu Fehlfunktionen oder zu schweren Defekten der Maschine führen.

Die Adressen, die mit dem Symbol ✓ gekennzeichnet sind, dürfen nur mit der Masterplatine verwendet werden.

SERIELLE KONFIGURATION DER PC03-PLATINE:

Zur Konfiguration der PCO³ Platine mit der Baud-Rate, der Netzadresse und dem gewünschten Protokolltyp sind aus dem Anwendermenü (Prog-Taste) folgende Masken auszuwählen:

Address for supervisor	001
Baud rate9600	(nur RS485)
Protocol	Modbus

HINWEISE ZUM LESEN/SCHREIBEN DER TIMER- UND ALARMÜBERSICHTSDATEN VOM ÜBERWACHUNGSSYSTEM AUS :

Zeitschalter :

Einstellung der nachfolgenden Zeitspannen aus dem Überwachungssystem:

Tag	DIENSTAG
Beginn der Zeitspanne 1	03:15 Ende der Zeitspanne 1 12:30
Beginn der Zeitspanne 2	14:30
Ende der Zeitspanne 2	20:00

Auszuführende Schritte:

- die analoge Variable 166 auf '3' einstellen (1=Sonntag; 2=Montag; ... 7=Samstag)
- die analoge Variable 158 auf '3' einstellen
- die analoge Variable 159 auf '15' einstellen
- die analoge Variable 160 auf '12' einstellen
- die analoge Variable 161 auf '30' einstellen
- die analoge Variable 162 auf '14' einstellen
- die analoge Variable 163 auf '30' einstellen
- die analoge Variable 164 auf '10' einstellen
- die analoge Variable 165 auf '00' einstellen
- die digitale Variable 74 einstellen, die die einzelnen Einstellungen speichert.

Umgekehrt, wenn die Einstellung wie folgt gelautet hätte:

Tag	DIENSTAG
Beginn der Zeitspanne 1	13:15
Ende der Zeitspanne 1	12:30
Beginn der Zeitspanne 2	14:30
Ende der Zeitspanne 2	20:00

würde in diesem Fall die digitale Variable 75 auf '1' eingestellt werden, auch wenn :
das ENDE der Zeitspanne 1 NIEDRIGER ist als der BEGINN der Zeitspanne 1;
das ENDE der Zeitspanne 2 NIEDRIGER ist als der BEGINN der Zeitspanne 2;
das ENDE der Zeitspanne 2 NIEDRIGER ist als der BEGINN der Zeitspanne 1.

Auch wenn während der Planung der Serie UR eine entsprechende Risikoanalyse durchgeführt wurde, vereinfacht die Anwendung der unten angeführten Bildzeichen das Lesen des Handbuchs, da die Aufmerksamkeit des Lesers unverzüglich auf die Gefahrensituationen gelenkt wird, die nicht verhindert bzw. auch durch Anwendung von technischen Maßnahmen und Schutzvorrichtungen nicht ausreichend beschränkt werden konnten. Sollen eine oder mehrere Zeitspannen deaktiviert werden, muss nur der BEGINN und das ENDE der Zeitspanne auf 00:00 - 00:00 eingestellt werden.

ALARMÜBERSICHT:

Für die Abfrage der Alarmübersicht aus dem bewachungssystem. Auszuführende Schritte:

- Die digitale Variable 79 so einstellen, dass man alle Informationen zu DATUM, EINTRITSTEMP., AUSTRITSTEMP.... in Bezug auf den letzten von der PC03-Platine registrierten Alarm erhält;
- die digitale Variable 78 zur Abfrage von Daten zum Alarmereignis, das vor dem angezeigten stattgefunden hat, einstellen;
- die digitale Variable 77 zur Abfrage von Daten zum Alarmereignis, das nach dem angezeigten stattgefunden hat, einstellen.

Werden nun die analogen Variablen 32, 33 und 167 bis 172 gelesen, erhält man alle Informationen zum ausgewählten Alarm.

Zum Rückstellen der Alarmübersicht aus dem Überwachungssystem:

- die digitale Variable 76 einstellen.

EINSTELLUNG DER STUNDE

Einstellung der Stunde aus dem Überwachungssystem.

Auszuführende Schritte:

- die neue STUNDE in der analogen Variablen 149 eintragen;
- die neuen MINUTEN in der analoge Variablen 151 eintragen;
- den neuen TAG in der analogen Variablen 153 eintragen (1=Sonntag; 2=Montag; ... 7=Samstag)
- das neue MONAT in der analogen Variablen 155 eintragen
- das neue JAHR in der analogen Variablen 157 eintragen (2 Ziffern);
- die digitale Variable 56 einstellen, die die soeben eingestellten Variablen kopiert.

ES

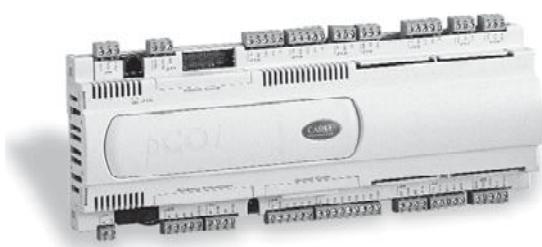

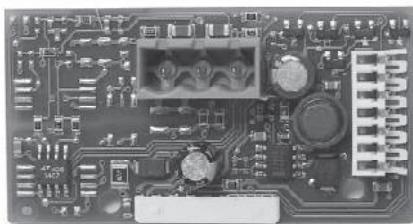

Fig. 1

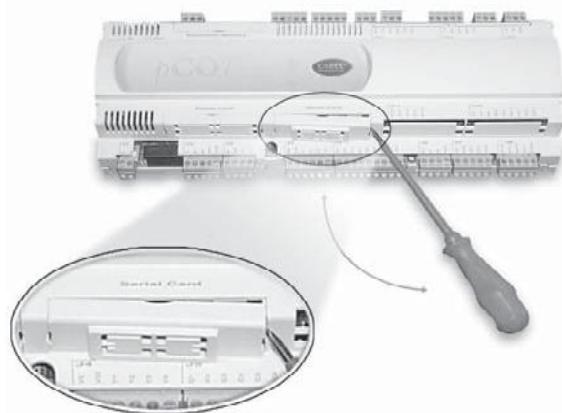

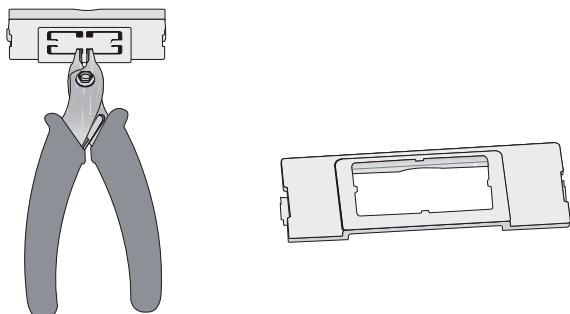

Fig. 2

**DESCRIPCIÓN**

La tarjeta AER485P1 es un accesorio de toda la familia de controles PCO3 (PCO3B excluidas) que permite la interfaz directa a una red RS485. La tarjeta garantiza el optoaislamiento del controlador con respecto a la red serial RS485. El baud rate máximo que se puede obtener es de 19.200 baudios (configurable vía software).

MONTAJE

En referencia a las Figs. 1 a 4, la conexión al PCO3 se obtiene siguiendo este procedimiento:

1. con un destornillador quitar la tapa "serial card" del controlador electrónico (véase la Fig. 1);
2. con unas tijeras de cortar metal, eliminar la parte de plástico pre-cortada de la tapa, consiguiendo así el orificio correspondiente a la salida del conector de 3 vías (véase la Fig. 2);
3. introducir la tarjeta opcional en el conector de rastillo correspondiente asegurándose de que la tarjeta haya sido introducida correctamente y bien encajada en las dos bases de plástico conectadas al contenedor del PCO3 (véase la Fig. 3);
4. cerrar la puerta con tornillos haciendo coincidir el conector expuesto de la tarjeta serial con el orificio realizado en la tapa (véase la Fig. 4).

La conexión a la red RS485 se obtiene mediante el conector de terminales extraíbles presente en la tarjeta.

Los significados de los pines en dicho conector (Fig. 5) se evidencian por la serigrafía de la tarjeta y enumerados en la fig. 6.

Si la tarjeta ocupa la última posición en la línea serial de supervisión, en los extremos de los pines 2 y 3 se conecta una resistencia de cierre de línea de valor 120 Ω - 1/4 W como se indica en el esquema de la Fig. 7

Características técnicas

Sección del cable:	usar cable trenzado y protegido de dos hilos AWG20/22 con secciones, en los terminales de mm2: mín. 0,2 - máx. 2,5.
Condiciones de funcionamiento:	-10T60 °C; 90 % HR.
Condiciones de almacenamiento:	-20T70 °C; 90 % HR.
Grado de contaminación:	normal.
Dimensiones (mm)	60x29x20, (60x29: barra, 20: ancho máximo de los componentes).

Advertencias. Precauciones al manejar la tarjeta

Los daños eléctricos que se comprueban en los componentes electrónicos se producen casi siempre a causa de descargas electrostáticas provocadas por el operador. Por lo tanto, se deben tomar las precauciones adecuadas para estas categorías de componentes y en particular:

- antes de manipular cualquier componente electrónico o tarjeta, tocar una puesta a tierra (el hecho de evitar tocar un componente no es suficiente, por cuanto una descarga de 10.000 V, tensión que se alcanza fácilmente con la electricidad estática, provoca un arco de aproximadamente 1 cm);
- los materiales deben permanecer dentro de sus envases originales mientras se pueda. Si es necesario, retirar la tarjeta del envase y transferirla en un embalaje antiestático sin tocar la parte trasera de la tarjeta con las manos;
- por todos los medios evitar usar bolsas de plástico, poliestireno o esponjas que no sean antiestáticas;
- por todos los medios evitar el paso directo entre operadores (para evitar fenómenos de inducción electrostática o descargas).

2	RX+/TX+
3	RX-/TX-

Guía de referencia para el protocolo modaer

El protocolo de comunicación Modaer representa el estándar de comunicación puesto a disposición por Aermec para la conexión entre refrigeradores y los sistemas de supervisión o controles centralizados (consultar la guía de productos Aermec para las máquinas en las cuales está disponibles este protocolo).

El protocolo permite la conexión tanto punto a punto (máquina * supervisor) como de varias máquinas (máx. 255) en un mismo bus de conexión hacia un supervisor, por cuanto prevé la gestión de una dirección para cada máquina. La modalidad de comunicación es tipo master-slave, por lo tanto el sistema de supervisión es master mientras que la máquina es slave. Esto significa que la máquina responde solamente a las consultas que hace el supervisor.

Configuración serial:

- 1.200 a 19.200 baudios
- 1 bit de start
- sin paridad
- 2 bits de shigh

Codificación de datos:

Cada palabra de 8 bits (1 byte) contenida en el mensaje está constituida por dos caracteres hex codificados con 4 bits cada uno (0-9, A-F).

Formato del mensaje:

Los campos que componen el mensaje se indican en la Tabla 1. El mensaje inicia con un intervalo de silencio de por lo menos 3,5 caracteres de longitud (indicados en la Tabla 1 como tiempo de silencio).

La duración de dicho intervalo depende del baud rate. El primer dato que se transmite es la dirección de la máquina; sucesivamente el tipo de solicitud (tipo de lectura o de escritura), los datos referidos a la solicitud, el checksum y finalmente un intervalo de silencio de la misma longitud del inicial.

Tab.1

START	tiempo de silencio
DIRECCIÓN	1 byte
MANDO	1 byte
DATO	n x byte
CHECKSUM	2 bytes
SHigh	tiempo de silencio

Dirección: es la dirección de la máquina y puede estar comprendida entre 1 y 255.

Mando: es la operación que se quiere realizar, la lista está en "Tab. 2. Pág. 2 "

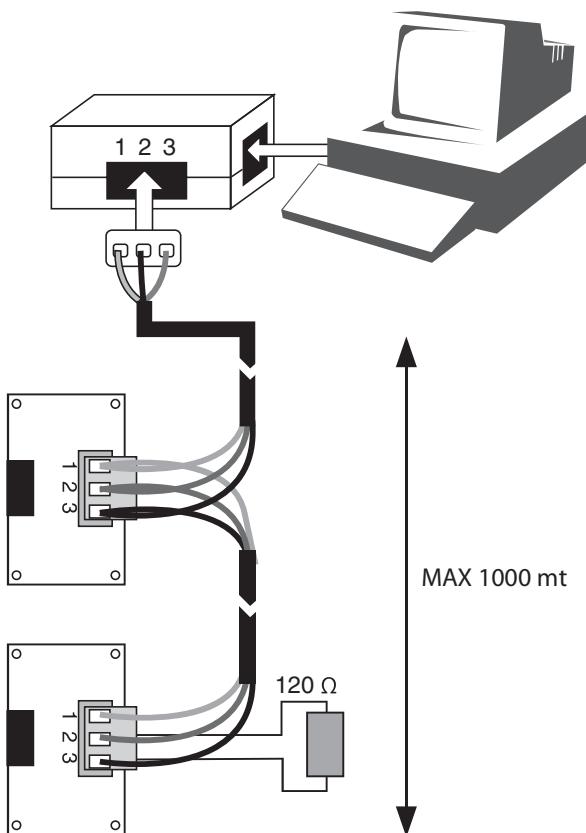

Checksum: es un control de seguridad para verificar que el dato transmitido sea correcto, y se calcula cada vez que se está transmitiendo el mensaje; quien lo recibe lo debe recalcular y comparar con el recibido para tener la seguridad que los datos recibidos son correctos.

El checksum se calcula considerando todos los campos excepto el campo checksum y considerando sólo los 8 bits de datos para cada byte (excluyendo bit de start y de shigh).

El checksum es un dato de 16 bits y se obtiene del siguiente modo:

1. programar el dato checksum de 16 bits con todos 1 (0xffff en hex)
2. realizar el exor con el sucesivo byte del mensaje (partiendo del primero, es decir la dirección)
3. realizar el shift de un bit (hacia el bit menos significativo) introduciendo un 0 en el bit más significativo
4. control en el bit menos significativo que se extrae luego del shift (bit de carry)
5. si el bit es 1, realizar el exor con el dato fijo hex 0xA001
6. repetir las operaciones desde el punto 3 hasta efectuar 8 shifts
7. repetir las operaciones desde el punto 2 para cada byte que compone el mensaje.

Fig. 7

Tipo de mandos:

Tab.2

Mando	Operación MASTER
01	Read datos digitales (datos 1 bit)
05	Write datos digitales (datos 1 bit)
03	Read datos analógicos (datos 16 bit)
06	Write datos analógicos (datos 16 bit)

Formato de los mandos:

Mando 01: Read Datos Digitales

Con este mando se pueden solicitar una o más variables digitales a partir de la dirección especificada. Los datos de respuesta se agrupan en byte (8 datos por cada byte). El primer byte recibido corresponde a los 8 datos con dirección más baja, el bit menos significativo de cada byte corresponde al dato con dirección más baja.

EJEMPLO:

SOLICITUD	
Campo	hex
Dirección de la máquina	01
Mando	01
Dirección de partida (byte high)	00
Dirección de partida (byte low)	00
Nº de datos (parte high)	00
Nº de datos (parte low)	0A
Checksum	...
RESPUESTA	
Campo	hex
Dirección de la máquina	01
Mando	01
Número de bytes dados en respuesta	02
Datos (0-7)	0E
Datos (8-9)	03E
Checksum	...

Mando 05: Write Digitales

Para asignar 1 a una dirección digital se debe transmitir el dato hex 0xFF00; para asignar 0 se debe transmitir el dato hex 0x0000.

Cualquier otro tipo de dato se gestiona como un error. La respuesta normal es un eco de la solicitud si la asignación del dato ha finalizado con éxito.

EJEMPLO:

SOLICITUD	
Campo	hex
Dirección de la máquina	01
Mando	05
Dirección (byte high)	00
Dirección (byte low)	00
Dato nuevo (parte high)	FF
Dato nuevo (parte low)	00
Checksum	...
RESPUESTA	
Campo	hex
Dirección de la máquina	01
Mando	05
Dirección (byte high)	00
Dirección (byte low)	00
Dato nuevo (parte high)	FF
Dato nuevo (parte low)	00
Checksum	...

Mando 03:

Read Datos Analógicos

Con este mando se pueden solicitar una o más variables y enteras a partir de la dirección especificada. La codificación adoptada es binaria en complemento a 2. Las variables analógicas se representan en décimos (por ejemplo: el valor 10,0 se transmite como 0064h = 100d), las enteras se transfieren con el valor efectivo (por ejemplo: 100 se transmite como 0064h = 100d).

Las variables enteras son aquéllas con dirección mayor de 128.

El número de datos solicitados se entiende a partir de la dirección.

EJEMPLO:

SOLICITUD	(hex)
Campo	
Dirección de la máquina	01
Mando	03
Dirección de partida (byte high)	00
Dirección de partida (byte low)	00
Nº de datos solicitados (parte high)	00
Nº de datos solicitados (parte low)	02
Checksum	...
RESPUESTA	
Campo	hex
Dirección de la máquina	01
Mando	03
Número de bytes dados en respuesta	04
Byte hight dato 0	0C
Byte low dato 0	03
Checksum	...

Mando 06: Write Datos Analógicos

Con este mando se puede escribir una variable analógica o entera. La codificación adoptada es binaria en complemento a 2.

Las variables analógicas se representan en décimos (por ejemplo: el valor 10,0 se transmite como 0064h = 100d), las enteras se transfieren con el valor efectivo (por ejemplo: 100 se transmite como 0064h = 100d).

Las variables enteras son aquéllas con dirección mayor de 128.

La respuesta normal es un eco de la solicitud si la asignación del dato ha finalizado con éxito.

EJEMPLO:

SOLICITUD	(hex)
Campo	
Dirección de la máquina	01
Mando	06
Dirección (byte high)	00
Dirección (byte low)	00
Dato nuevo (parte high)	1B
Dato nuevo (parte low)	00
Checksum	...
RESPUESTA	
Campo	hex
Dirección de la máquina	01
Mando	06
Dirección (byte high)	00
Dirección (byte low)	00
Dato nuevo (parte high)	1B
Dato nuevo (parte low)	00
Checksum	...

GESTIÓN DE TIMEOUT Y ERRORES DE COMUNICACIÓN

A continuación se analizan los posibles casos en los que puede producirse la comunicación y el comportamiento previsto por el master y por el slave como protocolo.

1. El slave recibe la solicitud sin errores de comunicación: slave: responde como lo ha programado el master : debe prever un timeout en la respuesta del slave de por lo menos 500 ms para darle la posibilidad de elaborar los datos.
2. El slave no recibe la solicitud por un error de comunicación del slave: no da ninguna respuesta al master: debe prever un timeout en la respuesta.

- El slave recibe la solicitud, pero existe un error de comunicación (por ej.: checksum), el slave: no da ninguna respuesta al master: debe prever un timeout en la respuesta.
- El slave recibe la solicitud sin errores de comunicación, pero los datos son incorrectos (por ej.: mando no previsto, solicitud de número de datos excedente, direcciones no previstas, valor dado en la escritura fuera de rango) el slave: responde normalmente con su dirección en el primer campo, en el campo mando responde agregando 0x80 al código del mando y como tercer byte responde con un código de error que identifica el error detectado. (véase el siguiente ejemplo).

Los códigos de error son los siguientes:

01	Mando no válido
02	Dirección dada no válida
03	Valor dado (en modo write) fuera de rango

EJEMPLO 1

Error de comunicación	SOLICITUD	
Campo		hex
Dirección de la máquina	01	
Mando	07	(mando no válido)
Dirección de la máquina	00	
Dirección (byte high)	00	
Dato nuevo (parte high)	1B	
Dato nuevo (parte low)	00	
Checksum	...	

EJEMPLO 2

Error de comunicación	RESPUESTA	
Campo		hex
Dirección de la máquina	01	
Mando	87	
Código de error	01	(código de error mando no válido)
Checksum	...	

FAMILIAS: RV - NW - NS - NSB - WS - WF

TABLAS DE DIRECCIONES

A continuación se indican las direcciones previstas por el protocolo el correspondiente significado desde el punto de vista de la máquina.

Las direcciones no detalladas son reservadas o no se utilizan; por lo tanto, no está permitido utilizar mandos referidos a direcciones no detalladas por cuanto esto podría provocar fallos o roturas de la máquina.

Las direcciones identificadas con el símbolo ✓ sólo se deben utilizar con la tarjeta master.

CONFIGURACIÓN SERIAL DE LA TARJETA PCO3:

Para configurar la comunicación serial de la tarjeta PCO³ con el Baud rate, la dirección de red y el tipo de protocolo deseado seleccionar las siguientes pantallas en el menú del usuario (tecla Prog.):

Address for supervisor	001
Baud rate	9600 (RS485 only)
Protocol	Modbus

NOTAS REFERIDAS A LA LECTURA/ESCRITURA DE DATOS TIMER E HISTORIAL COMO SUPERVISOR:

Temporizador:

Para configurar como Supervisor las siguientes franjas:

Días	MARTES
Start Franja 1	03:15
Start Franja 2	14:30
Shigh Franja 2	20:00

Operaciones a realizar:

- configurar en '3' la variable analógica 166 (1=Domingo; 2=Lunes; ...7=Sábado)
- configurar el valor '3' en la variable analógica 158
- configurar el valor '15' en la variable analógica 159
- configurar el valor '12' en la variable analógica 160
- configurar el valor '30' en la variable analógica 161
- configurar el valor '14' en la variable analógica 162
- configurar el valor '30' en la variable analógica 163
- configurar el valor '10' en la variable analógica 164
- configurar el valor '00' en la variable analógica 165
- programar la variable digital 74 que memoriza cada configuración.

Por el contrario, si la configuración hubiera sido:

Días	MARTES
Start Franja 1	13:15
Shigh Franja 1	12:30
Start Franja 2	14:30
Shigh Franja 2	20:00

En este caso la variable digital 75 se configurará en '1' aun cuando:

SHigh Franja 1 es MENOR que START Franja 1;
SHigh Franja 2 es MENOR que START Franja 2;
SHigh Franja 2 es MENOR que START Franja 1;

ATENCIÓN: Si se desea deshabilitar una o más Franjas basta configurar START y SHigh franja en 00:00 - 00:00.

HISTORIAL DE ALARMAS:

Para consultar el historial como Supervisor.

Operaciones a realizar:

- Programar la variable digital 79 para recibir las informaciones sobre FECHA, TEMP. IN, TEMP. OUT,... con respecto a la última alarma registrada por el PCO3;
- programar la variable digital 78 para solicitar datos referidos al evento de alarma anterior al visualizado;
- programar la variable digital 77 para solicitar datos referidos al evento de alarma siguiente al visualizado.

En este punto, leyendo las variables analógicas 32, 33 y de 167 a 172 se obtiene la información referida a la alarma seleccionada.

Para programar el Historial como Supervisor.

- programar la variable digital 76.

REGULACIÓN DE LA HORA

Para regular la hora como Supervisor.

Operaciones a realizar:

- configurar la HORA nueva en la variable analógica 149;
- configurar los MINUTOS nuevos en la variable analógica 151;
- configurar el DÍA nuevo en la variable analógica 153 (1=Domingo; 2=Lunes; ...7=Sábado);
- configurar el MES nuevo en la variable analógica 155;
- configurar el AÑO nuevo en la variable analógica 157 (2 cifras);
- programar la variable digital 56 que copia las variables que se han configurado.

Tabella parametri supervisione: RV - NW - NS - NSB - WS - WF / Parameters table oversight: RV - NW - NS - NSB - WS - WF

Smaltimento del prodotto

L'apparecchiatura (o il prodotto) deve essere oggetto di raccolta separata in conformità alle vigenti normative locali in materia di smaltimento.

Product Disposal

The device (or product) must be disposed of separately in accordance with local regulations regarding disposal.

Élimination du produit

L'appareillage (ou le produit) doit faire l'objet d'une collecte séparée conformément aux réglementations locales en vigueur en matière d'élimination.

Entsorgung des Produkts

Das Gerät (oder das Produkt) muss entsprechend den lokalen Entsorgungsvorschriften getrennt entsorgt werden.

Eliminación del producto

El equipo (o el producto) debe ser objeto de recogida selectiva acorde a lo especificado por las normativas locales vigentes en materia de eliminación.

SAMPLE of DUAL PRESSURE RELIEF VALVE INSTALLATION

Each refrigerant circuit to include dual pressure relief valves .

Configured to permit independent isolation and periodic testing of each valve .

TQ4200 INFRA-RED REFRIGERANT GAS DETECTION SYSTEM

FEATURES

- Cutting costs through ultra low level detection
- ECA approved, Automated Refrigerant Leak Detection System
- F-gas compliant for systems containing 300kg refrigerant
- No recalibration required in service
- Highly stable infra-red gas analyser
- Self-zeroing and failsafe
- Highly specific to target gas
- Multi-point sampling capability for up to 24 points
- Automatic pressure & temperature compensation
- MODBUS enabled for remote monitoring of multiple sites
- Can be integrated into third party data monitoring systems

The **TQ4200** is a compact, low cost solution to multipoint refrigerant gas leak detection. The system is available with a range of advanced ultra stable infra-red gas analysers, which require NO CALIBRATION in service. Pre programmed with several refrigerant gas types that can easily be changed in the field.

With proven reliability and minimal maintenance the **TQ4200** is designed for both industrial and commercial use e.g. Supermarkets, IT server farms, battery back-up rooms, food processing, storage & refrigeration, air conditioning and industrial cooling facilities. The TQ 4200 Provides F-gas solutions for larger installations and exceptional leak detection for all applications.

APPLICATIONS

- Retail Refrigeration
- Refrigerant machinery areas
- Air conditioning systems
- Chilled water plants
- Provision stores
- IT Server Farms

The **4200** system has been independently tested for inclusion in the ECA scheme, as an Automated Refrigerant Leak Detection System. Mandatory under the F-gas regulations for any refrigeration plant containing 300kg of refrigerant.

The System has a modulated broadband infra-red source to enable the detection of CFC's, HCFC's and their replacement, HFC's allowing the 4200 to accurately monitor different gas types simultaneously from a single detection panel.

Gases detected include:- **R22**, **R134A**, **R404A**, **R407C**, **R422D**, and **R507** with many more available upon request including **NH₃**. Providing an ideal solution when upgrading from **R22** applications.

TQ Environmental Plc, operate a policy of continual product development which means the specification is subject to change without prior notice. For full assistance with your application contact TQ Environmental.

D2-4200-0809

Gas monitoring solutions

The 4200 samples from up to 24 points and analyses the gas sequentially from each point. Each gas sample is conditioned by passing it over particulate filters and water catch pots, to ensure that the reliability of the infra-red analyser is not compromised. Accurate multiple calibration allows sampling from independent refrigeration plants containing different refrigerant gases.

The system requires a universal 100-250 Vac power supply rated at 5 amps. Connection of the sample lines completes the self contained operation.

SPECIFICATION

Dimensions	w: 350 d: 200 h: 450mm
Weight	12kg
Tubing Connection	6mm/4mm flexible
Sample Gas Flow	0-8 litres/minute
Electrical Supply	Universal 100-250 Vac
Detection Technique	Non-Dispersive Infra-red
Gases Measured	HFC's, CFC's and HCFC's
Measurement Ranges	Typical range 0-1000 ppm
Accuracy	Minimum detection level 10 ppm Minimum Alarm point 20 ppm
Response Times	T90 <7s
Display	2 line alpha-numeric 40 LCD
Controls	Programmable zone ID, Red/Green LED's, front panel push buttons
Alarm Signals	3 Configurable SPCO Volt free alarm relays and fault relay
Output Signals	2 x 4-20mA analogue linear outputs, MODBUS serial communications
Temperature	-10° C to +45° C
Humidity	0-95%RH (Non-condensing)
Pressure/Temp Compensation	Internal automatic

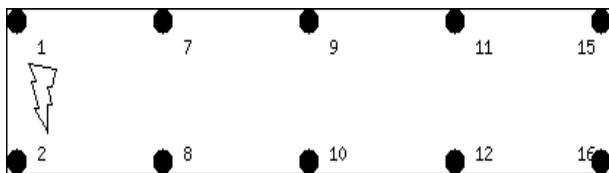

PARTS LIST

8 Channel, Bottom entry	370-502
16 Channel, Bottom entry	370-500
24 Channel, Bottom entry	370-503
6mm OD Sample Tubing	100-053
End of Line Filter	420-030

I Istruzioni per la corretta installazione dei supporti antivibranti a molla

GB How to correctly install the vibration clampening springs supports

- Il kit prevede 10 supporti antivibranti a molla dotati di piastre in acciaio e relativi martinetti M16. Il martinetto viene utilizzato quando è necessario registrare : il livello della macchina sospesa, piani di appoggio sconnessi e/o errori nel prevedere il carico incidente.
- The kit comprises 10 antivibration spring mounts provided with steel-plate and relevant M16 jacks.. The jack is used to adjust:the level of the suspended machine, disconnected support surfaces and/or in case of mistakes in calculating the incident load.*

7	GVR622-1305Pr	8	GVR630-133P
9	RZ602-105Pr	10	RZ602-108Pr
11	GVR630-1305P	12	GVR7301P
15	RX602-Z108Pr	16	RZ608-112Pr

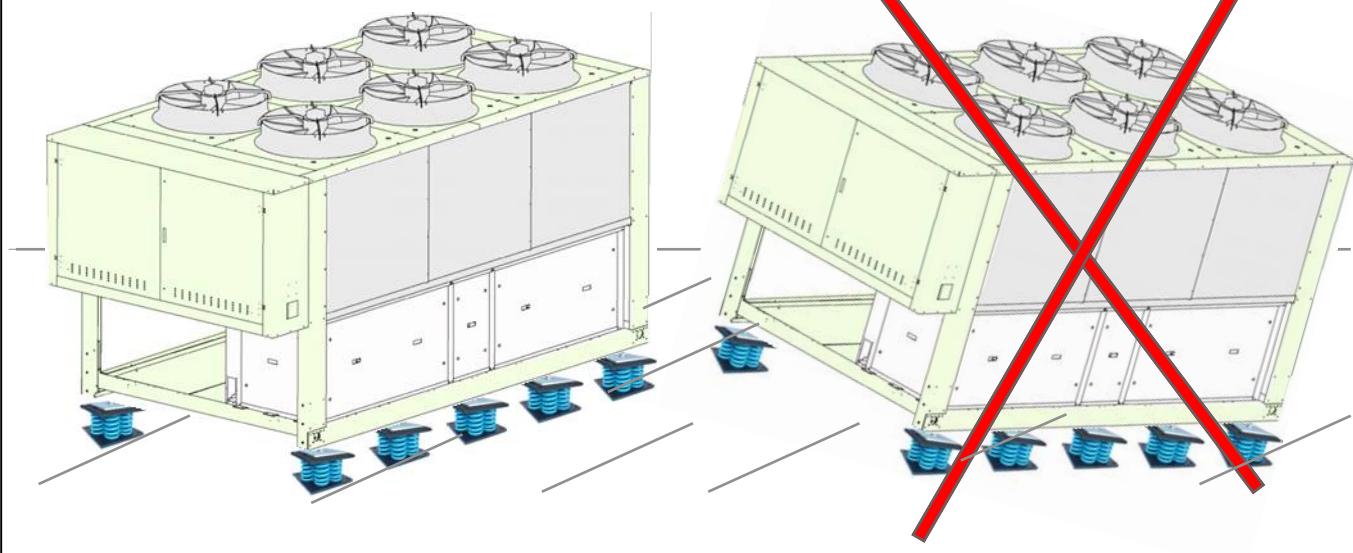

La collocazione dei Supporti Antivibranti e relativi interassi è riportata sul manuale tecnico e d'installazione "refrigeratori NSB."

The position of the antivibration mounts and relevant centre distances is shown in the technical and installation manual "NSB refrigerators"

MISURE DI SICUREZZA □ SAFETY MEASURES

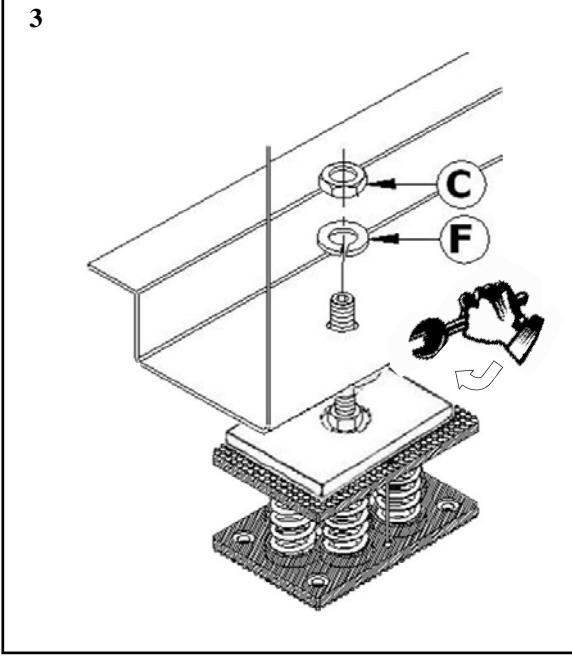

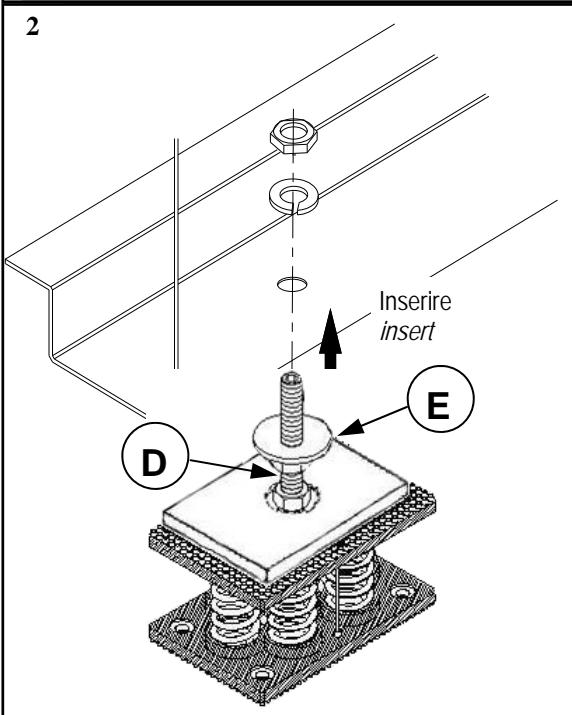

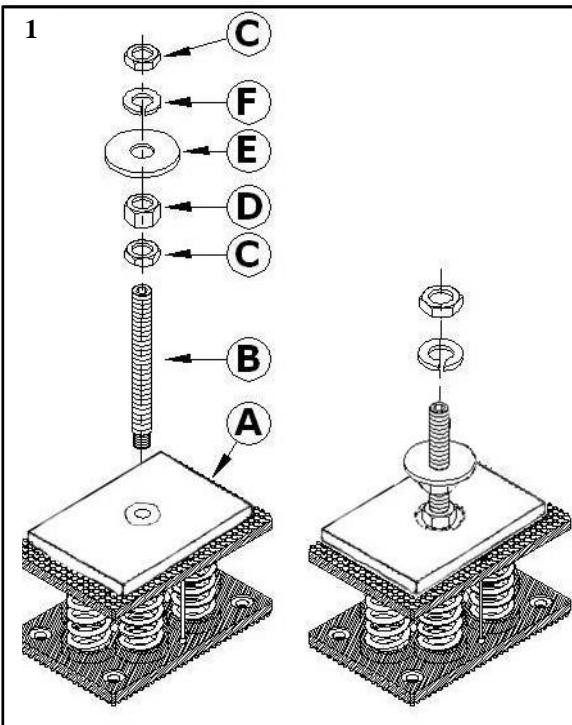

Installare gli antivibranti sotto la macchina una volta collocata sulla zona di posa!

Install the anti-vibration under the machine once placed in the area of installation!

- Accertarsi che ad ogni punto di appoggio corrisponda il modello di antivibrante selezionato.
- Assicurarsi che la macchina completa di Supporti Antivibranti venga posizionata a terra perpendicolamente rispetto al piano di appoggio.

- Make sure that the selected antivibration model corresponds to each support point.
- Make sure the machine complete with antivibration mounts is positioned on the ground right angles to the support surface.

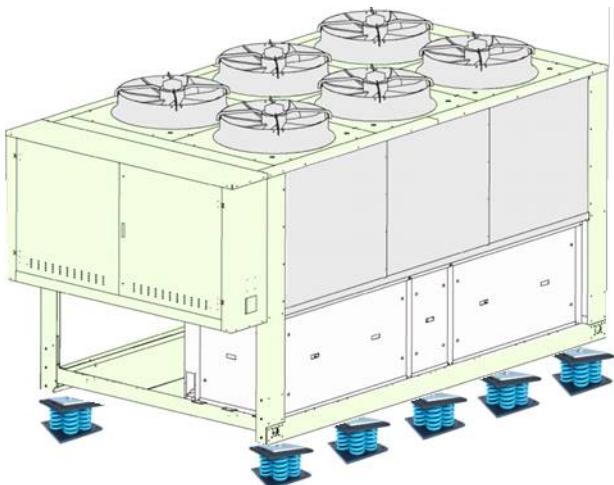

I Installazione del Supporto Antivibrante con l'utilizzo del martinetto :
GB Fitting the Antivibration Mount using the jack :

- fig. 1) Procedere con l'assiemaggio dei componenti il martinetto.
- fig. 2) Inserire il martinetto nella sede filettata predisposta sulla piastra superiore dell'antivibrante. Inserire successivamente il martinetto montato sull'antivibrante, nel foro predisposto sul basamento della macchina.
- fig. 3) Accertarsi che il basamento della macchina sia appoggiato sulla rondella piana (pos.E) del martinetto. Per compensare eventuali dislivelli, agire sul dado alto (pos.D), utilizzando una chiave 24. Bloccare la posizione ottenuta con rondella grower (pos.F) e rispettivo dado basso (pos.C). Al termine dell'operazione controllare che la macchina sia libera da vincoli.

- fig. 1) Proceed to assemble the jack components.
- fig. 2) Fit the jack in the threaded housing on the upper plate of the antivibration mount. Next fit the jack mounted on the antivibration mount in the hole in the machine base.
- fig. 3) Make sure the machine base is resting on the flat washer (pos. E) of the jack. To offset any levelling problems, adjust the top nut (pos.D) using a 24 spanner. Lock in position with grower washer (pos.F) and low nut (pos.C).
- At the end of this operation, make sure the machine is free of restraints.

4 La tipologia di macchina configurata è indicativa. The type of machine shown is approximate.

NSB 3402 A&E - FC

F Instruction pour une correcte installation des plots antivibratoires à ressort

D Anleitung zur korrekten Montage der Schwingungsdämpfer-Federn

- Le kit prévoit 10 plots à ressort doués de palques en acier et vérins correspondants M16. Le vérin est utilisé : lorsqu'il est nécessaire de régler le niveau de la machine suspendue; en cas de plans d'appui disjoints et/ou d'erreurs dans le calcul de la charge d'incidence.
- Das Set umfaßt 10 Schwingungsdämpfer-Federn mit Platten im Stahl und zugehörigen Winden M16. Die Winden werden für folgende Einstellungen verwendet: zur Nivellierung der angehobenen Maschine, bei unebenen Auflageflächen und/oder Fehlern bei der Einschätzung der auftretenden Belastung.*

POS	MOD.	POS	MOD.
1	RZ612-120P	2	GVR620-133Pr
7	GVR622-1305Pr	8	GVR630-133P
9	RZ602-105Pr	10	RZ602-108Pr
11	GVR630-1305P	12	GVR7301P
15	RX602-Z108Pr	16	RZ608-112Pr

La disposition des plots et des entraxes relatifs est indiquée dans le manuel technique et d'installation "refroidisseurs NSB".

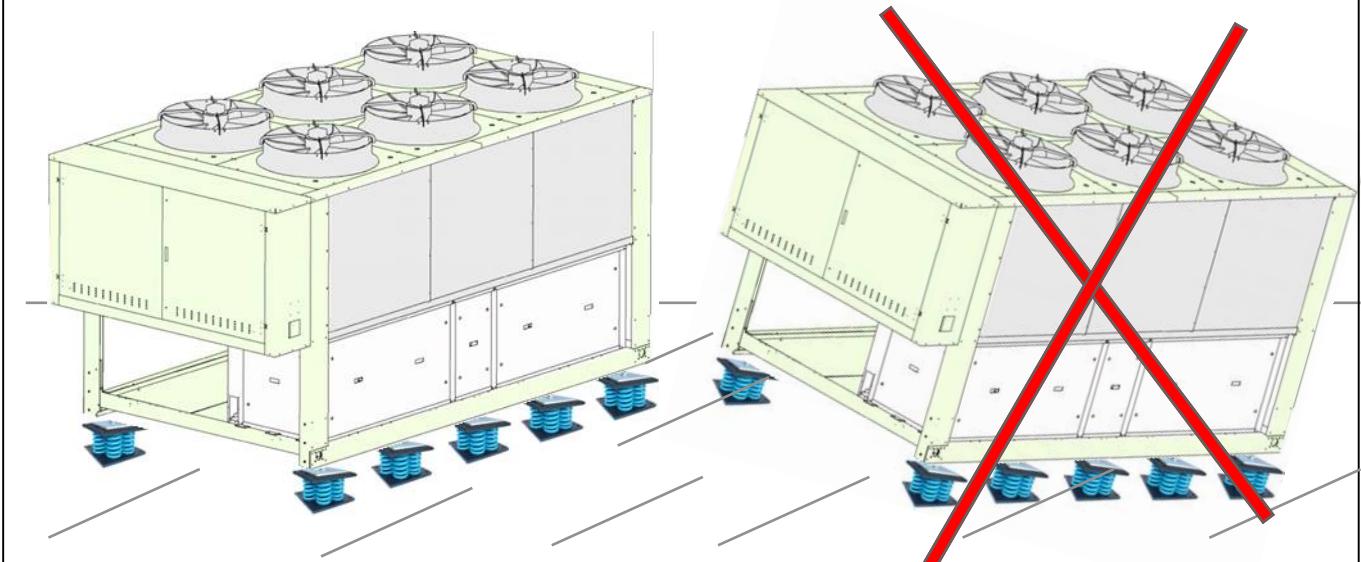

Die positionen und zugehörige Abstände der Schwingungsdämpfer sind im technischen und Installationshandbuch "kühler NSB" angegeben.

DE SECONSIGNES URITE • MONTAGE DER SCHWINGUNGSDÄMPFER

Installer les anti-vibration sous la machine une fois placés dans le domaine de l'installation!

Installieren Sie Anti-Vibration unter dem machine einmal im Bereich der Installation platziert!

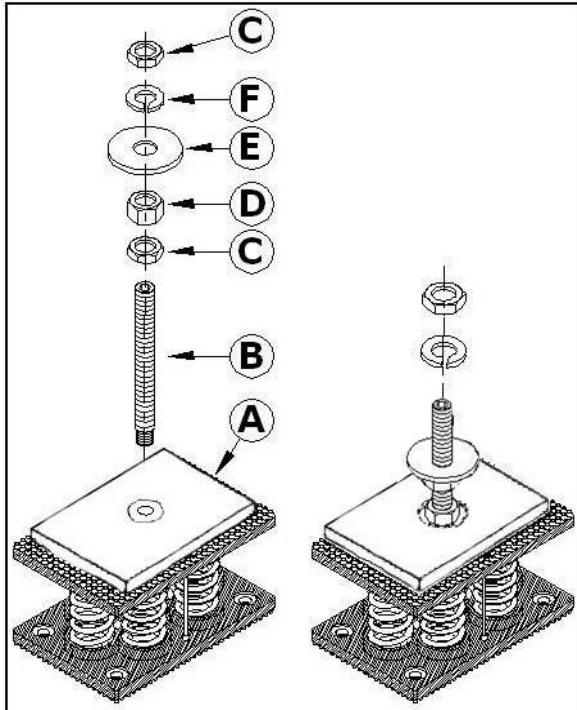

**NON !
NEIN !**

- Vérifier qu'à chaque point d'appui correspond le modèle de plot sélectionné
- Vérifier que la machine avec les plots soit positionnée à terre perpendiculairement au plan d'appui.

- *Sicherstellen, daß das gewünschte Schwingungsdämpfermodell mit den jeweiligen Auflagestellen übereinstimmt.*
- *Sicherstellen, daß die mit Schwingungsdämpfern ausgestattete Maschine lotrecht zur Auflagefläche auf dem Boden positioniert wird.*

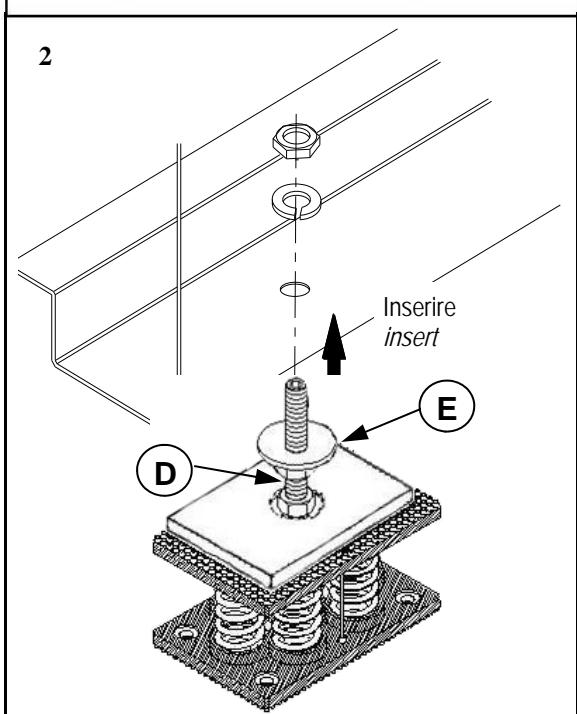

INSTALLATION DES PLOTS ANTIVIB. - MONTAGE DER SCHWINGUNGSDÄMPFER

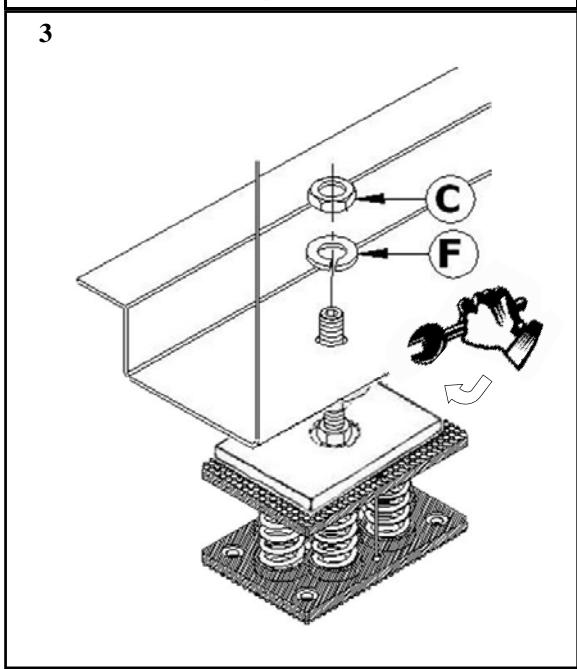

F Installation du plot Antivibratoire avec l'emploi du vérin

D Montage der Schwingungsdämpfer unter Einsatz der Winden

- fig. 1) Assembler les éléments du verin.
- fig. 2) Insérer le vérin dans le logement fileté prévu sur la plaque supérieure du plot. Puis insérer le vérin monté sur le plot dans le trou prévu sur le bâti de la machine.
- fig. 3) Vérifier que le bâti de la machine repose sur la rondelle plate (pos.E) du vérin. Pour compenser les dénivélés éventuels, agir sur l'écrou haut (pos.D), en utilisant une clé 24. Bloquer la position obtenue avec la rondelle grower (pos.F) et l'écrou bas correspondant (pos.C). A la fin de l'opération, contrôler que la machine soit libre de tout lien

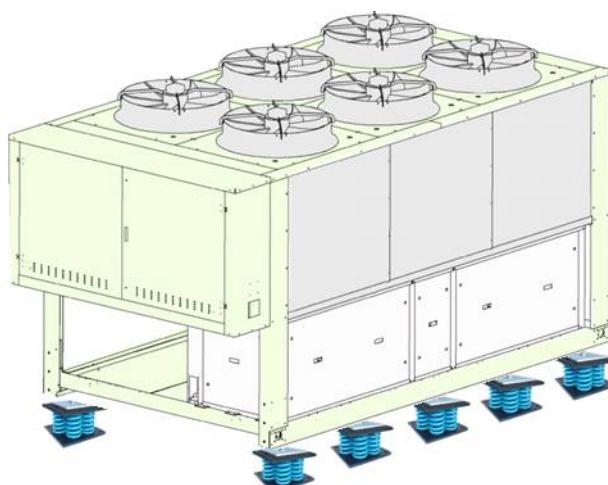

- abb. 1) Die Komponenten der Winde montieren.
- abb. 2) Die Winde in den Gewindesitz der oberen Schwingungsdämpferplatte einführen. Anschließend die auf dem Schwingungsdämpfer angebrachte Winde in die Bohrung im Maschinenuntergestell einführen.
- abb. 3) Sicherstellen, daß das Untergestell der Maschine auf der flachen Scheibe (pos.E) der Winde aufliegt. Zum Ausgleich eventueller Höhenunterschiede mit Hilfe einer 24 er-Schlüssels die große Mutter (pos.D), einstellen. Die so erzielte Position mit einer Federscheibe (pos.F) und zugehöriger flacher Mutter (pos.C) blockieren. Nach Beendigung des Arbeitsschrittes sicherstellen, daß die Maschine nicht gebunden ist.

4 Le type de machine représentée est indicatif.

Die abgebildete Maschinentypologie dient lediglich als Beispiel.

antivibranti serie G... ...alcune combinazioni...

I Per identificare il modello adatto ad isolare le frequenze in campo, consultare il nomogramma a pag. 1.

Il supporto antivibrante G... è formato da:

- Molle in acciaio armonico UNI 7900 con superficie protetta da trattamento cataforetico
- 2 corpi di contenimento molle, formati da piastre in acciaio da 5 mm di spessore, trattate con processo elettrolitico di zinco giallo. Ogni piastra è fornita di guanto-cuscinetto in elastomero antiolio; le superfici del guanto-cuscinetto presentano cilindretti deformabili antiscivolo
- Cuscinetti in materiale plastico interposti tra molle e piastre in acciaio interrompono la continuità del suono
- 2 tiranti in nylon da 2,5 mm e speciali bussolete cromate, assicurano il bloccaggio delle molle tra i corpi di contenimento

A richiesta:

- Martinetto disponibile in acciaio zincato o inox, raccomandato per la registrazione della quota macchina

GB To identify the model suitable for the insulation of the frequencies in use, refer to the nomograph on page 1.

The antivibrating mount line G... is formed of:

- Springi in acciaio armonico UNI 7900 con superficie protetta da trattamento cataforetico
- 2 corpi di contenimento molle, formati da piastre in acciaio da 5 mm di spessore, trattate con processo elettrolitico di zinco giallo. Ogni piastra è fornita di guanto-cuscinetto in elastomero antiolio; le superfici del guanto-cuscinetto presentano cilindretti deformabili antiscivolo
- Plastic bearings between the spring and the plates avoid the sound transmission
- 2 nylon braces 2,5 mm thick and special bushings assure the locking of the springs between the plates

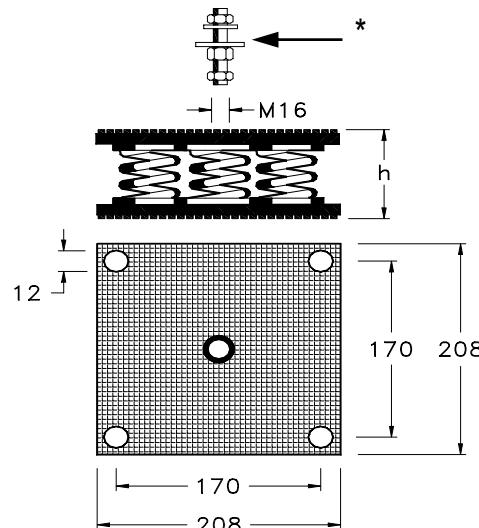

On request:

- Jack available in stainless steel or steel coated with zinc, it is recommended to gauge the machine

Le dimensioni e le caratteristiche delle attrezzature riportate nel presente, non vincolano la Soleco engineering s.r.l. e possono essere variati senza alcun preavviso

The dimensions and the features of the equipments mentioned in this price list can be changed by Soleco engineering s.r.l. without notice.

INTRODUCTION

PROJECT: St Georges Court

CUSTOMER: Gratte

MANUFACTURER: AERMEC SpA
Via Roma 44-37040
Bevilacqua (Verona) Italy

EQUIPMENT: 1-off NS2202XBEAK & 1 off NS3602XEAK

This project involves the supply and commissioning of 4-off NS type air-cooled water chillers. The chillers are manufactured by AERMEC and one of each type shall be run tested in the factory prior to delivery to site to verify performance. The chiller shall be performance witness tested in accordance with this document and witnessed by client's representatives at AERMEC's production facilities in Italy.

The test shall be carried out in three parts. Firstly, the chiller shall go through a functional pre-test and set-up procedure involving Aermec personnel. Then, on the date identified herein, the chiller shall go through a performance witness test followed by an acoustic test.

A. Functional pre-test (Aermec)

Complete a physical inspection of the unit and accessories. Check the integrity of the refrigerant circuit by pressure testing with nitrogen. Charge the unit and review operation of the refrigerant circuit. Measure the inlet and outlet water temperatures, flow rates and electrical performance of the chiller.

B. Witness performance test (Aermec + customers)

Run the chiller for one hour to achieve steady state conditions at 100% full load. The performance test is to be conducted 35°C ambient in the Production Test Chamber. Test operation of alarms. Simulate summer design operating conditions. Verify chiller performance against technical schedule. Issue a test certificate for customer approval.

C. Acoustic test (Aermec + customers)

The acoustic test is conducted outside the test chamber to eliminate the influence of the chamber fan noise and prepare it for the sound test run in the evening when the background noise is at a minimum. The chiller will be complete with both circuits running at full load.

ITINERARY

Witness Testing of AERMEC NS air-cooled water chillers

PROJECT: St Georges Court

METHOD STATEMENT

STANDARD FACTORY PERFORMANCE TEST

Equipment: 1 No. NS2202XBEAK air cooled water chiller
1 No. NS3602XEAK air cooled water chiller

Ref: Production Test Facility – Production Test Chamber

Standard Functional Test (carried out prior to witness test)

1. Pre-charge unit with nitrogen for checking purposes
2. Test for leakage
3. Discharge the circuit
4. Establish a vacuum to remove all gas and to eliminate moisture inside the refrigerant circuit
5. Charge the unit with R134a refrigerant
6. Control gas charge through the sight glass and pressure gauges
7. Connect the inlet and outlet water connections to the testing room plant
8. Set the water flow to the correct flow rate
9. Cable up the power to the unit
10. Carry out test of voltage and frequency on the electrical panel
11. Program the microprocessor control with basic working parameters
12. Set up the expansion valves and trim the refrigerant charge
13. Start up each compressor and test electrical data
14. Set up all the pressure switches
15. Initiate a controlled start-up of each condenser fan
16. Calibrate the various temperature and pressure probes on the circuit

Customer Witness Operational Performance Test

1. Test the alarms on the microprocessor:-
 - a. High pressure alarm
 - b. Low pressure alarm
 - c. Compressors alarm
 - d. Evaporator freeze alarm
 - e. Flow switch alarm
2. Test of probe failure
3. Set the design set-point and configure the unit for design working conditions
4. Run the chiller in the Production Test Chamber at full load conditions at design conditions:-

	NS 3602XE AK	NS 2202XBE AK
a. Chilled water:	6 °C / 12 °C	6 °C / 12 °C
b. Flow rate:	29.7 l/s	16.01 l/s
c. Glycol:	n/a	n/a
d. Design Ambient:	35°C	35°C

5. Record the performance data on the test report sheet
6. Run the chiller at full load conditions for one hour to reach steady state full load condition
7. Print a copy of the test report for customer approval
8. Test to be in accordance with ISO14511

WITNESS FACTORY ACOUSTIC TEST (AERMEC+CUSTOMER)

The Total Sound Power data declared for the NS 2202XBE AK is 90 dB(A)

The Total Sound Power data declared for the NS 3602XE AK is 92 dB(A)

Acoustic Test Procedure

- 1) Position the unit outside the test chamber to eliminate the influence of the chamber fan noise and prepare it for the sound test run
- 2) Prepare and calibrate the test instrument
Sound Intensity Analyser : BRUEL & KJAER PULSE
Measured Sound Level : Sound Power
Filter : A
- 3) Measure the sound intensity levels from one module within 1 metre from the unit all round and above in accordance with ISO 9614-2.2, Acoustics. All octave band readings to be taken simultaneously.
- 4) Shut down the chiller and measure the background noise level.
- 5) Record the results.
- 6) Calculate the sound pressure levels in accordance with ISO 3744:1994 Acoustics and Eurovent tolerances

Issue a test certificate for customer approval and signature

Attention: Mr Andrew Rogers

19th October 2012

Dear Andrew

RE: St. Georges Court – Chillers

With reference to our quotation Q12138-01J dated 13th September 2012, we are pleased to confirm the following:

- 1) The chillers proposed are generally in compliance with the amended Blyth and Blyth schedules as submitted by yourself via e-mail on 11th September, with the exception only of some of the data on the Office chillers due to reselection to a different type of chiller i.e. Screw chiller instead of Turbocor.
- 2) The chillers proposed are in compliance with the acoustic criteria detailed in the Hann Tucker report reference 17797/BS Rev C dated 10th August 2012.

Yours sincerely
on behalf of Aermec UK

A handwritten signature in black ink, appearing to read "Rex J. Murden".

Project Name:	ST Georges Court, Bloomsbury Way, Holborn WC1A				
Project No:	GB5236	Sheet Ref:	TS010	Rev:	C
Issued to:	Kier Construction/Blyth and Blyth			Issue date:	11/11/2013
				Approval date:	18/11/2013
Description of equipment:	Supply fans, extract fans and associated attenuators manufactured by Nuaire Ltd and listed on attached fan schedule				
Locations where equipment is to be used:	See attached schedule				
Manufacturer / Supplier:	Nuaire Limited Western Industrial Estate, Caerphilly, CF83 1NA Telephone 02920858200				
Specification clause references and deviations:	Blyth and Blyth Mechanical Specification Document 2.3 Mechanical Equipment Schedule_I8_290113 See also Blythe & Blythe comments on previous Technical Submission.				
Drawing details:					
Enclosures / samples attached:	Specific Technical Specification Documents				
Additional information:	All units technically comply to Blyth and Blyth Specification

Company	Date	Status (A-B-C)	Comments		
B & B Comment	22/07/2013	B	AHU/G/01.	<ul style="list-style-type: none"> • Efficiency and on/off temperatures to be confirmed. • BMS interface to be confirmed. 	
GBL/Nuaire Response	08/11/2013		<ul style="list-style-type: none"> • Actual efficiency of the heat exchanger is dependent on a number of factors, but based on 'normal' operating conditions we would expect it to be between 75 & 80%. • The unit is equipped with 0-10V connections for fan speed control and VFCs for run/fault to facilitate BMS connection. 		
B & B Comment	22/07/2013	B	EF/G/01, 02 & 03	<ul style="list-style-type: none"> • Hann Tucker to confirm attenuator selection. • BMS interface to be confirmed. 	
GBL/Nuaire Response	08/11/2013		<ul style="list-style-type: none"> • Await Hann Tucker Report • The unit is equipped with 0-10V connections for fan speed control and VFCs for run/fault to facilitate BMS connection. 		
B & B Comment	22/07/2013	B	EF/R/01 & 03	<ul style="list-style-type: none"> • Has required duty been verified. • SFP/Eff does not comply with Building Regulations • Why has this been changed from approved fan selection. 	
GBL/Nuaire Response	08/11/2013		<ul style="list-style-type: none"> • System pressure loss is correct • To achieve an SFP of 0.6 W/l/s, the external pressure should be reduced to approx. 80Pa. It has been adversely affected by the addition of the matched silencers. If it is feasible to only utilise a room side silencer, the figure of 120Pa is acceptable. 		

B & B Comment	22/07/2013	B	EF/R/02 <ul style="list-style-type: none"> • Has required duty been verified.
GBL/Nuaire Response	08/11/2013		• System pressure loss is correct
B & B Comment	22/07/2013	B	EF/R/04 <ul style="list-style-type: none"> • Basement refuse appears to have been omitted.
GBL/Nuaire Response	08/11/2013		The Basement unit has been relocated to roof level – refer to GBL working drawings.
B & B Comment	22/07/2013	B	SF/G/01 <ul style="list-style-type: none"> • Has required duty been verified. • SFP/Eff does not comply with Building Regulations • Hann Tucker to confirm attenuator selection. • Pressure drop and noise reduction figures to be issued • BMS interface to be confirmed.
GBL/Nuaire Response	08/11/2013		• System pressure loss is correct • The SFP requirement for a supply fan with heater (Part L 2010) is 1.2W/l/s, therefore we believe that this selection is compliant. • Await Hann Tucker Report • Pressure drop across the attenuators in negligible, and noise reduction is as shown on data sheets. • The unit is equipped with 0-10V connections for fan speed control and VFCs for run/fault to facilitate BMS connection.
B & B Comment	22/07/2013	B	SF/B/01 <ul style="list-style-type: none"> • Has required duty been verified. • Flow rate to be upgraded to 400 L/s to comply with Building Control
GBL/Nuaire Response	08/11/2013		• System pressure loss is correct • The selected fan will achieve the required air-flow rate (0.4 m3/s), with a SFP of 1.0 W/l/s – revised data sheet attached.

B & B Comment	22/07/2013	B	<p>EF/B/05 a & b</p> <ul style="list-style-type: none"> • Quantity 2 No. • We note fans have been selected for 50%-50% operation. Total per fan 935 L/s – total A/F 1892 L/s. • Confirmation required of fan arrangement and pressures. • Attenuator to be fire rated. • Hann Tucker to confirm attenuator selection.
GBL/Nuaire Response	08/11/2013		<ul style="list-style-type: none"> • We have included 2 fans. Attenuators are fire rated to the same spec as fans (300 deg.C for 2 hours – one-off operation) • Await Hann Tucker Report
B & B Comment	22/07/2013	B	<p>EF/B/06 a & b</p> <ul style="list-style-type: none"> • Quantity 2 No. • Single speed notation – is this inverter driven for 6 a/c & 10 a/c. • SFP to be based on 6 a/c operation. • Attenuator to be fire rated. • Confirmation required of fan arrangement and pressures. • Under Smoke Mode inverter to be bypassed by hard wiring to the fan. Inverter location to be confirmed.
GBL/Nuaire Response	08/11/2013		<ul style="list-style-type: none"> • We have included 2 fans. Both are inverter controllable (inverters to be supplied by Controls specialist). Based on ‘day-to-day’ duties (1.11m³/s, the external resistance will be reduced to 106Pa – calculated using fan laws), the SFP will be 0.3 W/l/s. • Attenuators are fire rated to the same spec as fans (300 deg.C for 2 hours – one-off operation) • Noted – will be actioned by BMS subcontractor

B & B Comment	22/07/2013	B	EF/R/07 a & b <ul style="list-style-type: none"> • Quantity 2 No. • SFP/Eff does not comply with Building Regulations • 2 No fans 50% - 50% dual fan operation. Each fan 214 L/s • Fan configuration to be confirmed.
GBL/Nuaire Response	08/11/2013		<ul style="list-style-type: none"> • We have included 2 fans. It is Nuaire's understanding that dedicated smoke extract fans are exempt from the SFP requirements of Part L (and current ErP directives).
