**SITE INVESTIGATION
17 & 19 FERDINAND STREET
LONDON**

1 INTRODUCTION

In May, ASL were instructed by GLA Architecture & Design Ltd on behalf of the client, S. Aspris & Son Ltd, to undertake the necessary site investigation and consultancy services associated with the proposed development at the site known as 17 & 19 Ferdinand Street, London.

A site investigation is required in order to determine the ground conditions at the site ahead of its proposed redevelopment. It is understood that the proposed development comprises the demolition of the onsite structures and the construction of a new four-storey building with commercial properties present on the ground floor and residential apartments on the upper floors. A proposed development plan is presented in Appendix I.

The scope of works for this project was set out in ASL's proposal reference 077-11-101.elo.1174r1 dated 10th April 2015 which was formerly accepted by GLA Architecture & Design Ltd, on behalf of S. Aspris & Son Ltd, in their email dated 21st May 2015.

This report presents a desk study, the development of a conceptual site model, the factual results from an intrusive investigation and subsequent laboratory analyses and interpretative comment in terms of the geotechnical properties of the ground conditions encountered at the site in relation to the proposed development together with an assessment of the contaminative status of the site.

This report has been prepared for the sole benefit of the Client, S. Aspris & Son Ltd and their representatives and agents. The report has been written based on the results of data searches and ground conditions encountered at the time of the investigation and the results of subsequent analyses. Future changes in legislation and advances in current best practises or provision of more detailed design proposals will result in this report requiring review and possible further assessment after the date of issue. The general notes section within this report should be noted in relation to the limitations of this investigation and assessment.

2 THE SITE

The site is located to the west of Ferdinand Street, in the London Borough of Camden, approximately 4.25km north-west of London city centre. The site can be located approximately by National Grid Reference TQ 283 843 as shown on Figure 1.

The site is roughly rectangular with the long axis aligned approximately east to west with maximum dimensions of approximately 40m by 20m. The site is generally flat lying with no significant changes in elevation across the site.

The site currently comprises a two-storey warehouse type structure utilised as a food and drinks wholesalers. It should be noted that the easternmost portion of the site is only single storey. There are two further storeys present above this portion of the site which currently comprise residential properties.

The site is bound to the south, east and west by residential properties and to the north by a courtyard which provides access and parking to the site and adjacent properties. Further residential and commercial properties are present beyond the courtyard to the north.

At the time of the investigation the residential structure to the immediate west and north-west was undergoing a major refurbishment.

Access to the site is gained via a road leading off Ferdinand Street to the west, which provides access to the courtyard area.

It is understood that the proposed development comprises the demolition of the onsite structures and the construction of a new four-storey building with commercial properties present on the ground floor and residential apartments on the upper floors. A proposed development plan is presented in Appendix I.

3 GEOLOGY

The British Geological Survey (BGS) Sheet No. 256 North London (Solid and Drift) shows the site to be devoid of drift geology and directly underlain by solid geology of the London Clay Formation described as 'clay, silty in part'. The thickness of the London Clay Formation is not indicated in the vicinity of the site, however it is anticipated to extend to significant depth.

In addition to the published geology it is considered that Made Ground of variable thickness may be present across the site as it has undergone previous development.

The environmental database search indicates the site to be in an area where new homes or extensions do not require radon protection measures.

The site is indicated to be in an area that may not be affected by coal mining and in an area with no hazards associated with non coal mining activities.

Further details are presented in Appendix II.

4 HYDROGEOLOGY

The London Clay Formation is classified by the EA as an Unproductive Strata defined as 'these are rock layers or drift deposits with low permeability that have negligible significance for water supply or river base flow.'

There are no discharge consents to groundwater located within 0.5km of the site.

There are nine abstractions from groundwater located within 1km of the site. The closest six abstractions relate to the abstraction of groundwater for 'commercial/industrial/public services' associated with Kentish Town Sports Centre located approximately 520m to the north-east. The remaining listings relate to the abstraction of groundwater for 'public water supply: potable water supply - direct' located approximately 980m to the south-west.

The site is not indicated to be in a Source Protection Zone (SPZ). A boundary with a SPZ II (outer zone) is located approximately 615m to the south-west.

Further details are presented in Appendix II.

5 HYDROLOGY

The nearest surface water feature is identified as the Grand Union Canal (Regents Canal) located approximately 360m to the south-east. This surface water feature is classified as a Category E – poor watercourse chemically and biologically by the EA in the vicinity of the site.

There are three discharge consents to surface water located within 1km of the site. All of the listings relate to the discharge of 'cooling water' to the Grand Union Canal located approximately 380m and 445m to the south-east and south, respectively.

There are four abstractions from surface water located within 0.5km of the site. The listings relate to the abstraction of surface water for 'non-evaporative cooling', 'amenity

spray irrigation' and 'industrial cooling' located approximately 360m and 380m to the south.

The site is not indicated to be in an area susceptible to flooding from rivers and seas.

Further details are presented in Appendix II.

6 SITE HISTORY

The history of the site has been derived from historical OS maps dating back to 1875. The map extracts are presented in Appendix III. Table 1 below presents a summary of the key developments in and around the site shown on the historical map extracts.

Table 1 Summary of Site History

Date of Map Extract	On site and surrounding Land-use
1875 (1:2500)	The majority of the site appears to be undeveloped, with a fountain in its central portion. A billiard saloon is present within the south-west of the site Structures are present to the immediate south, east and west. A large area of railway sidings indicated to be a goods depot, which includes a number of goods sheds, is present approximately 75m to the south.
1896 (1:2500)	Structures are now present within the central and eastern portions of the site, which extend beyond the site to the north. Further structures are present within the goods depot to the south. A coal depot is present approximately 150m to the south-west.
1916 (1:2500)	The site area remains generally unchanged. The structure in the west of the site is now indicated to be a pianoforte works.
1954 (1:1250)	The pianoforte works has undergone expansion and now covers the entire site area. Apparent residential and localised commercial/industrial development has taken place to the north. Works are present to the immediate east and south-east. Further works, factories and garages are present within the vicinity of the site.
1955 – 1966 (1:1250 & 1:2500)	The site and surrounding area remain generally unchanged.
1970 – 1973 (1:1250 & 1:2500)	The site and immediate surrounding area remain generally unchanged. Significant residential redevelopment has taken place to the north and north-east.
1982 (1:1250)	The site and area to the immediate north have undergone limited redevelopment the layout of which is broadly consistent with that currently existing. The site is now indicated to be a works. A garage is present approximately 10m to the south-west. The large goods shed to the south is now indicated to be a distribution centre. The coal depot to the south-west is no longer present. The former warehouse/goods shed structure to the south-west is now indicated to be a theatre. Some of the structures and infrastructure associated with the goods depot to the south are no longer present. An electricity substation is present approximately 30m to the north.
1987 (1:1250)	The site and immediate surrounding area remain generally unchanged. A significant portion of the railway sidings to the south are no longer present.
1991 – 1992 (1:1250)	The site and immediate surrounding area remain generally unchanged.
1994 (1:1250)	The site area remains generally unchanged. The large distribution centre to the south east is no longer present. Limited road infrastructure development has occurred on the former goods depot site to the south.
1995 (1:1250)	The site area remains generally unchanged. Significant residential and commercial development has taken place to the south.
1996 – 2015 (1:1250 & 1:10000)	The site and the surrounding area remain generally unchanged.

The site is indicated to have comprised undeveloped land and a billiards saloon until approximately 1896 after which structure are indicated to be present across the site which have undergone various phases of development until approximately 1982, after which the layout is broadly consistent with that currently present onsite. The onsite structure is indicated to have been a pianoforte works and a works. The surrounding area is indicated to have comprised a mixture of residential, commercial and industrial land uses.

7 ENVIRONMENTAL DATABASE SEARCH

This section details any relevant information from registers maintained by the EA. Information provided by the BGS, The Coal Authority, Health Protection Agency and the National Environment Research Council (NERC) is also considered. The information held by the various bodies is summarised below and presented in detail in Appendix II.

It should be noted that the information provided in the desk study is obtained from independent third party sources. It is provided in good faith, but no guarantee can be provided as to its accuracy. Independent enquiries should be made relating to information provided in the desk study information that may impact on the proposed development. The desk study information is not necessarily exhaustive and further information relevant to the site may be available from other sources.

7.1 Database Search Results

There are no registrations listed within 0.5km of the site under the following:

- Contaminated Land Register Entries and Notices;
- Enforcement and Prohibition Notices;
- Integrated Pollution Controls;
- Integrated Pollution Prevention and Control;
- Local Authority Integrated Pollution Prevention and Control;
- Local Authority Pollution Prevention and Control Enforcements;
- Pollution Incidents to Controlled Waters;
- Prosecutions Relating to Authorised Processes;
- Prosecutions Relating to Controlled Waters;
- Water Industry Act Referrals;
- Any landfill sites;
- Integrated Pollution Control Registered Waste Sites;
- Licensed Waste Management Facilities (Landfill Boundaries);
- Registered Waste Treatment or Disposal Sites;
- Any hazardous substances sites.

The following sections discuss the database search results which identified registrations listed within 0.5km of the site.

7.2 Environment Agency Search Results

There are eleven Local Authority Pollution Prevention and Controls located within 0.5km of the site. The closest listing relates to a petrol filling station located approximately 75m to the west. The status of this site is detailed as 'site closed'. The remaining listings are located at distances greater than approximately 195m from the site.

There are two Registered Radioactive Substances listings located within 0.5km of the site. The closest listing is registered to Omnilabs (UK) Ltd, located approximately 430m to the south-east, and relates to the disposal of radioactive wastes. The status of this listing is detailed as 'authorisation either revoked or cancelled'. The remaining listing is registered to Unilabs Clinical Pathology located approximately 450m to the south-east. The status of this listing is detailed as 'application made in error'.

There is one Substantiated Pollution Incident Register entry located within 0.5km of the site. This listing relates to the release of 'atmospheric pollutants and effects: smoke'

located approximately 390m to the south-east. This listing is detailed as having no impact to land or and a significant impact to air.

There is one Licensed Waste Management Facilities (Locations) located within 0.5km of the site. This listing relates to a Household Waste Amenity Site located approximately 430m to the south-east. The license status of this facility is detailed as 'surrendered'.

There are two Registered Waste Transfer Sites located within 0.5km of the site. Both listings are located approximately 460m to the south-east and relate to a recycling centre. The input rate of this facility is detailed as 'small (equal to or greater than 10,000 and less than 25,000 tonnes per year). The license status of this facility is detailed as 'licence has completion certificate surrendered'.

Further details are presented in Appendix II.

7.3 Contemporary Trade References

There are numerous contemporary trade references within 0.5km of the. The closest listings relates to a 'food products - manufacturers' located approximately 10m to the north-west. This listing is detailed as being 'inactive'. The closest active listing relates to an 'ice cream manufacturers and suppliers' located approximately 25m to the south-east.

Further details are presented in Appendix II.

7.4 Fuel Station Entries

There are three fuel filling stations located within 0.5km of the site. The closest listing relates to Morrisons Camden, located approximately 90m to the south-east. The remaining listings relate to an obsolete site located approximately 195m to the north-west.

Further details are presented in Appendix II.

8 ASSESSMENT OF POTENTIAL CONTAMINATION RISKS

8.1 General

The following sections identify potential sources of contamination at the site and the surrounding area. The receptors to any contamination are also identified together with the pathways by which the contamination may make contact with the receptors. This section of the report uses the guidance presented in CLR 11 'Model Procedures for the Management of Land Contamination' produced by DEFRA and the EA to develop a conceptual site model as a 'source-pathway-receptor' model in accordance with current best practise.

8.2 On-Site Sources of Contamination

The potential sources of on-site contamination are associated with the site's former land-uses. The site is indicated to have comprised undeveloped land and a billiards saloon until approximately 1896 after which the site is indicated to have been occupied by a pianoforte works and a works.

The former uses of the site as undeveloped land and a billiards saloon are not classified by the Department for Environment, Food and Rural Affairs and the Environment Agency's document CLR8 as being potentially contaminative land-uses.

The former use of the site for a pianoforte works and a works are classified in CLR8 as being a potential source of contamination in the form of metals, sulphates, asbestos, pH, cyanide, phenol, acetone, aromatic hydrocarbons, polycyclic aromatic hydrocarbons, chlorinated aliphatic hydrocarbons and PCBs.

There is the potential for incidental leaks and spills from vehicles. This is a potential source of contamination in the form of oil and fuel based hydrocarbons. No visual or olfactory evidence of contamination was noted during the site walkover.

Given the previous development of the site, there is the potential for Made Ground to be present at the site. Should Made Ground be identified, a general suite of contaminants should be considered. Any Made Ground materials may also be a potential source of hazardous ground gas.

Due to the age of the structure present at the site, there is the potential for asbestos to be present within the building fabric. It is recommended that an asbestos survey is completed prior to demolition of the on-site structures.

8.3 Off-Site Sources of Contamination

Numerous works, garages and depots have historically and are currently located in the vicinity of the site. These sites are considered to be potential sources of contamination similar to those detailed in Section 8.2. These sites are also considered to be potential sources of hazardous ground gas.

8.4 Receptors

The receptors to any potential contamination and therefore the element actually at risk from the potential sources of contamination have been identified as the following:

- Human Health – Construction/maintenance workers and future site users (R1);

- Service Lines – Constructed as part of the new development and currently existing (R2);
- Surface Water – canal located approximately 360m to the south-east (R3);
- Groundwater beneath the site – Unproductive Strata (R3);
- Neighbouring properties and residents (R4).

8.5 Pathways

A pathway is the means by which a contamination source makes contact with the receptor creating a pollutant linkage. The three elements of an identified pollutant linkage (source-pathway-receptor) need to be present for there to be a perceived risk from any identified contamination present in soils and/or groundwater.

The pathways considered in this assessment are as follows:

- Direct Physical Contact – Dermal contact, ingestion, inhalation (PL1);
- Migration from soils to groundwater via leaching (PL2);
- Migration within groundwater (PL3);
- Migration via service lines (PL4);
- Volatilisation of contaminants from soils and groundwater (PL5);
- Migration of hazardous ground gases (PL6).

8.6 Conceptual Site Model

The conceptual site model has been produced in accordance with the guidance presented in DEFRA R&D Publication CLR11 to produce this source-pathway-receptor model.

The desk study assessment of the site's environmental setting has identified potential pollutant linkages that may pose a risk to human health and controlled waters. The potential pollutant linkages are detailed in the conceptual site model, Figure 3.

The conceptual site model assumes the presence of contamination on the site in the Made Ground and/or the near surface soils and should be refined in relation to the results of the investigation as necessary. Refinement should also be made should the nature of the development result in pollutant linkages being broken. Refinements as necessary will be discussed in the qualitative risk assessment section of this report.

Table 2 below presents a summary of the identified pollutant linkages.

Table 2 Summary of Pollutant Linkages

Potential Source of Contamination	Potential Pathway	Description / Comment	Potential Receptor
Former use of the site as a works.	PL1, PL2, PL3, PL4, PL5, PL6	Potential for contamination and hazardous ground gas production. Presence not yet proven.	R1, R2, R3, R4, R5
Made Ground present at the site.		Potential for Made Ground to be present. Presence not yet proven but expected.	
Incidental leaks and spills from parked vehicles		Potential for contamination and hazardous ground gas production. No visual or olfactory evidence of contamination noted at the site.	
Numerous historical and current works, garages and depots located in the vicinity of the site.	PL1, PL5, PL6	Potential for contamination and hazardous ground gas production. Due to the expected cohesive nature of the underlying geology, the potential for contamination and hazardous ground gas to migrate to beneath the site is considered to be low.	R1
Asbestos present within existing building fabric	PL1	Presence not yet proven	

8.7 Summary

The potential pollutant linkages noted in Table 2 will be discussed in light of the findings of the intrusive investigation from which an assessment of the actual risks posed by any contamination to the identified receptors will be determined.

From the assessment of the potential pollutant linkages the critical receptor is considered to be site end users (female adult for a commercial development). Maintenance and construction workers, service lines and neighbouring properties may also require consideration.

Groundwater hydraulically down gradient of the site is also considered to be a potential critical receptor. However, the site is indicated to be underlain by Unproductive strata and is not located within a groundwater Source Protection Zone. There are no groundwater abstractions within 0.5km of the site. In addition the proposed development comprises structures and hardstandings across the entire site which will limit the potential for leaching of contaminants from the soils present onsite. Therefore, the potential risk posed to groundwater is considered to be very low.

It is recommended that an asbestos survey is completed prior to commencement of the development works.

9 GROUND INVESTIGATION AND TESTING

9.1 Ground Investigation

The scope of works was defined for the project by ASL and comprised three windowless sampler boreholes. The intrusive investigation was designed to target the location of the proposed development. This investigation was completed to obtain information relating to the geotechnical properties of the underlying ground conditions and the contaminative status of the site. The position of the exploratory hole has been taped from recognised features on the site and plotted on Figures 2 of this report.

The ground investigation was carried out in general accordance with BS 5930: 1999+A2 (2010) 'Code of Practice for Site Investigations' and BS10175 (2011) 'Code of Practice for the Investigation of Potentially Contaminated Sites' and in accordance with current best practice.

The scope of works for the ground investigation was as follows:

- 3 No. windowless sampler boreholes (WS) to a maximum depth of 4.45m bgl;
- Insitu standard penetration tests (SPT) at regular intervals;
- Installation of combined gas and groundwater monitoring standpipes at selected WS;
- Chemical and geotechnical laboratory testing;
- Gas and groundwater monitoring programme.

The ground investigation was undertaken on 4th June 2015. The intrusive investigation was supervised by a suitably experienced geo-environmental engineer from ASL. The exploratory holes were logged by the supervising engineer and the logs are presented in Appendix IV.

9.2 Gas and Groundwater Monitoring Programme

A single monitoring event was conducted on 19th June 2015 and comprised level measurement of methane, oxygen, carbon dioxide, carbon monoxide, hydrogen sulphide, relative and atmospheric pressure, gas flow rate and groundwater level. The results of the gas and groundwater level monitoring are presented in Table IVa of Appendix IV.

9.3 Laboratory Testing

Selected soil samples were scheduled for chemical testing for a range of contaminants in order to determine the general contaminative status of conditions on the site. A general suite of testing was selected as no significant potential sources of contamination were identified.

The two samples were scheduled for chemical laboratory testing for the following determinants:

Arsenic, Boron (water soluble), Beryllium, Cadmium, Chromium, Copper, Cyanide (free and total)
Lead, Mercury, Nickel, Selenium, Vanadium, Zinc, Poly-cyclic Aromatic Hydrocarbons (PAH) (16
No. speciated), Total Petroleum Hydrocarbons (TPH), pH, Phenols, Sulphate (soluble), Sulphide,
Total Sulphur, Total Sulphate, fraction of organic carbon, asbestos (Made Ground only).

The chemical testing is being undertaken by a UKAS accredited laboratory in accordance with the MCERTS accreditation where available.

The results of the chemical laboratory testing are presented in Appendix V.

9.4 Geotechnical Laboratory Testing

Geotechnical laboratory testing was completed on selected soil samples. The samples have been scheduled for Atterberg Limit testing to assess shrinkage potential and sulphate testing to assess the concrete classification for the proposed development.

The results of the geotechnical laboratory testing are presented in Appendix V and VI.

10 GROUND, GROUNDWATER AND GAS CONDITIONS

10.1 Materials Encountered

The published geology provided by the BGS indicates the site to be devoid of drift geology and directly underlain by solid geology of the London Clay Formation.

In addition to the published geology the intrusive investigation identified variable thicknesses of Made Ground, underlain by possible Alluvium materials. Strata of the London Clay Formation was encountered underlying the possible Alluvium materials at all of the exploratory hole locations.

Table 3 below presents a summary of the ground conditions encountered during the intrusive investigation. Full details of the conditions encountered are presented on the exploratory hole logs in Appendix IV.

Table 3 Summary of Strata Encountered

Description	Top of Unit (m bgl)		Thickness of Unit (m)		SPT 'N' Value
	Min	Max	Min	Max	
<p>Made Ground Brown and grey, locally slightly clayey, slightly sandy to very sandy GRAVEL of angular to rounded fine to coarse brick, concrete, ceramic, clinker, flint and quartzite. Occasional brick cobbles;</p> <p>Brown grey locally yellow brown slightly clayey SAND and GRAVEL. Gravel is angular to subrounded fine to coarse brick, concrete, flint, ceramic, quartzite and occasional clinker;</p> <p>Very soft to firm brown mottled light brown, grey and dark grey slightly sandy to sandy slightly gravelly to gravelly CLAY. Gravel is angular to rounded fine to coarse brick, ceramic, concrete, flint, quartzite and coal. Occasional pockets of brown slightly clayey slightly gravelly sand;</p>	0.09	0.21	1.09	1.33	0 – 4
<p>Possible Alluvium Soft to firm green grey and brown mottled grey, dark grey and black silty to very silty slightly gravelly organic CLAY. Gravel is angular to rounded fine to coarse quartzite and rare flint. Slight organic odour. Locally rare rootlets;</p>	1.30	1.50	0.60	0.90	4
<p>London Clay Formation Firm brown and brown grey locally mottled grey silty CLAY. Rare to occasional selenite crystals.</p>	1.90	2.40	1.05*	2.45*	8 - 12

Notes:

- * = Base not proven

In addition to the strata summarised above a concrete floor slab was present at surface at all of the exploratory borehole locations and was found to be between 0.09m and 0.21m in thickness.

Three SPTs were completed within the Made Ground materials that recorded SPT 'N' values of between 0 and 4, indicating typically extremely low to very low strength cohesive materials.

A single SPT was completed within the possible Alluvium materials that recorded an SPT 'N' value of 4, indicating very low strength cohesive materials.

Five SPTs were completed within the London Clay Formation strata that recorded SPT 'N' values of between 8 and 12, indicating medium strength cohesive materials.

Two samples of the possible Alluvium and one sample of the London Clay Formation were scheduled for Atterberg Limit determinations and moisture content analyses to determine their geotechnical properties.

The results of the Atterberg Limit tests indicate the possible Alluvium materials tested to comprise clays of extremely very high to extremely high plasticity with liquid limits of 75% and 110%, plastic limits of 20 and 23% and plasticity indices of 55% and 87% indicating the materials to be of high volume change potential. Natural moisture contents of 32% and 36% were recorded for the samples tested, indicating the materials to be in a state of desiccation.

The results of the Atterberg Limit tests indicate the London Clay Formation materials tested to comprise clay of very high plasticity with a liquid limit of 88%, a plastic limit of 22% and a plasticity index of 66% indicating the materials to be of high volume change potential. A natural moisture contents of 31% was recorded for the sample tested, indicating the materials to be in a state of desiccation.

The test results are presented in full in Appendix VI.

10.2 Groundwater

Groundwater was not encountered in any of the exploratory borehole during their formation, however damp strata were noted in WS1 between 1.0m and 1.5m bgl. During the subsequent monitoring event groundwater was recorded within the monitoring installations at depths of 2.27m and 2.83m bgl at WS1 and WS2, respectively.

Full details are presented in Appendix IV.

10.3 Gas

As part of the monitoring event below ground gas levels within monitoring standpipes were measured during a single monitoring event completed on 19th June 2015. The results are presented in full in Table IVa of Appendix IV.

Methane, carbon monoxide and hydrogen sulphide were not recorded in excess of the relevant analytical detection limits of the apparatus used.

Carbon dioxide was recorded in excess of the analytical detection limits of the apparatus used at both monitoring installations at concentrations of 2.3% and 1.4% by volume (v/v) at WS1 and WS2, respectively.

Oxygen was monitored above the analytical detection limits of the apparatus used at both of the monitoring installation at concentrations of 18.4% and 19.3% v/v.

Average borehole flow rates and average downhole pressures were recorded as zero during the monitoring event.

The monitoring event was completed during a period of high atmospheric pressure.

11 GEOTECHNICAL ASSESSMENT

11.1 General

It is understood that the proposed development comprises the demolition of the onsite structures and the construction of a new four-storey building with commercial properties present on the ground floor and residential apartments on the upper floors. A proposed development plan is presented in Appendix I.

The ground conditions encountered during the intrusive investigation comprised a limited thickness of Made Ground overlying possible Alluvium materials underlain by cohesive materials of the London Clay Formation.

11.2 Foundation Assessment

Due to their inconsistency, variability and typically low strength the Made Ground and possible Alluvium materials are not considered a suitable founding stratum.

It is considered that conventional foundations could be placed within the cohesive London Clay Formation materials, at a depth of approximately 2.0m to 2.5m bgl, designed to a net allowable bearing pressure of 75kN/m² to limit total settlements to 25mm and differential settlements to acceptable levels.

However due to the high anticipated loads associated with the proposed development it is considered that a piled foundation will need to be adopted, with piles transferring structural loads into the deeper London Clay Formation strata at depth beneath the site.

It is recommended that further deeper intrusive investigation comprising a cable percussion borehole is undertaken to confirm the nature of the deeper strata to provide the required geotechnical information for pile design. Due to access restrictions at the site, these additional works will need to be undertaken following demolition of the existing onsite structure.

It is recommended that the advice of a specialist piling contractor is sought with regards to the design and installation of any piled foundation solution employed at the site following the completion of the additional deeper intrusive investigation.

11.3 Floor Slabs

Due to the presence of significant thickness of Made Ground and possible Alluvium materials across the site area it is recommended that a suspended floor slab, with suitable floor void is adopted for the proposed development.

11.4 Excavations

Excavation of the materials encountered on site is likely to be achieved using conventional plant, however, it is expected that many obstructions remain in the ground at shallow depths, such as former foundations and machine pits and the use of pneumatic/hydraulic breakout equipment will be required, particularly within confined excavations.

Shallow excavations should remain stable in the short term. However, deeper excavations may be prone to collapse, particularly in association with inflows of water. Consequently, temporary support should be considered for all excavations where collapse is to be avoided. Heavier duty closed shoring should be provided for any excavation where man

entry is necessary, in compliance with statutory requirements to ensure safe working conditions.

Where excavations are to be undertaken within the vicinity of adjacent structures and load bearing walls it is recommended appropriate precautions are adopted to prevent instability.

11.5 Dewatering

Groundwater was not encountered in any of the exploratory borehole during their formation, however damp strata were noted in WS1 between 1.0m and 1.50m bgl. During the subsequent monitoring event groundwater was recorded within the monitoring installations at depths of 2.27m and 2.83m bgl at WS1 and WS2, respectively.

It is therefore considered that groundwater issues may occur within excavations forming part of the proposed development. Where inflows occur within excavations it is considered these are likely to be sufficiently controlled by conventional sump pumping techniques.

11.6 Buried Concrete Classification

Based on the results of chemical laboratory testing undertaken on samples recovered from the Made Ground and possible Alluvium, it is considered that a Design Sulphate Class "DS-3" and an Aggressive Chemical Environment for Concrete (ACEC) site classification "AC-3" should be adopted for all concrete placed in contact with these materials, such as foundations, piles and services.

The results of chemical laboratory testing undertaken on samples recovered from the London Clay Formation materials it is considered that a Design Sulphate Class "DS-5" and an Aggressive Chemical Environment for Concrete (ACEC) site classification "AC-5" should be adopted for all concrete placed in contact with materials.

If a piled foundation solution is to be adopted it is considered that a Design Sulphate Class "DS-4" (based on water soluble sulphate) and an Aggressive Chemical Environment for Concrete (ACEC) site classification "AC-4" could be adopted for all concrete placed in contact with materials, such as piles.

11.7 Gas Protection Measures

The gas monitoring results indicate gas conditions corresponding to a Hazardous Gas Flow (HGF) of <0.07l/hr indicating Characteristic Situation 1 (CS1 – characterised as very low potential hazard). Therefore, in accordance with the guidance provided by BS 8485 and CIRIA 665 the incorporation of specific gas protection measures is not required for the proposed development.

This conclusion should be agreed with the relevant regulatory authorities prior to the commencement of development works to confirm that the assessment completed meets with their requirements and further monitoring to verify these results is not required.

12 CONTAMINATION ASSESSMENT – HUMAN HEALTH

12.1 Introduction

The results of the chemical laboratory testing undertaken on selected soil samples (see Section 9.3), have been compared where possible to the relevant industry guidance as detailed in the following section.

Defra have published Development of Category 4 Screening Levels (C4SL) for Assessment of Land Affected by Contamination (document reference SP1010, dated 20th December 2013). This document includes proposed C4SL for six contaminants of concern. In March 2014 it was agreed that the C4SL could be used as part of the planning process. The chemical laboratory test results have therefore been compared where relevant to the C4SL. The C4SL have been derived based on the proposed end use of the site. In this instance an end use of 'commercial' has been considered the most appropriate. Should the proposed development at the site change the potential risk posed by the identified contamination should be reviewed.

It is noted that the C4SL for benzo(a)pyrene has been derived as a surrogate marker for all genotoxic PAH species including this determinant. The remaining genotoxic PAH species included in the completed priority 16 PAH suite of analysis are considered to be benzo(a)anthracene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(ghi)perylene, chrysene, dibenzo(ah)anthracene and indeno(123cd)pyrene. Assessment criteria are therefore not considered necessary for these determinants.

C4SLs have not been provided for the full range of determinants assessed as part of this contamination assessment. Further Generic Assessment Criteria (GAC) in accordance with this guidance are currently in production. Contaminated Land Exposure Assessment (CLEA) guidance to assess the risk to human health (Document References SC050021/SR2, SC050021/SR3, SC050021/SR4 and SC050021/SR7) is available. As a result GAC for the relevant contaminants of concern included in this report have been derived in accordance with this CLEA guidance and spreadsheet Version 1.06. These criteria are considered to remain appropriate as C4SL are proposed to be more pragmatic whilst still highly precautionary when compared to the previously published guidance and associated SGVs. The GAC in this report are therefore considered to be conservative and define a lower level of risk in consideration of the potential risk to human health when compared to the current guidance and C4SL. The derived GAC are presented in Appendix VII.

Laboratory data at the site recorded an average result of approximately 1.88% for soil organic matter calculated using fraction or organic carbon results. The GAC for the site are therefore conservatively calculated assuming 1.88% SOM.

12.2 Chemical Test Results - Soils

The results of the chemical laboratory testing undertaken on the selected soil sample are summarised in Table 4. Only those determinants recorded in excess of their relevant laboratory detection limits are assessed here. At Tier 1 TPH is assessed using the GAC for the aliphatic TPH fraction >C12-C16. This GAC is selected as it is the most stringent of the TPH fractions.

The chemical test results on soil are presented in full in Appendix V.

**Table 5 Summary of Soils Data with Respect to Human Health (Tier 1)**

Contaminants	Max Conc. (mg/kg)	Defra C4SL mg/kg (Commercial)	CLEA Derived GAC mg/kg (Commercial)	No. of Tests
Arsenic	20	640 (0)	-	3
Beryllium	1.3	-	899 (0)	3
Boron	5.7	-	316000 (0)	3
Chromium	31	-	31900 (0)	3
Copper	94	-	34600 (0)	3
Lead	580	2300 (0)	-	3
Mercury	1.1	-	8.08 [^] (0)	3
Nickel	22	-	1790 (0)	3
Vanadium	68	-	10300 (0)	3
Zinc	190	-	476000 (0)	3
Total TPH	14	-	41.5 [^] (0)	3
Benzo(a)pyrene	0.21	77 (0)	-	3
Fluoranthene	0.25	-	72600 (0)	3
Pyrene	0.24	-	54500 (0)	3

Note:

1. Number in brackets represents the number of results above guideline values.
2. [^] Denotes theoretical saturation limit taken as representative at Tier 1.

In addition to the determinants summarised in Table 4, asbestos was analysed for in two samples of Made Ground recovered from WS1 and WS2 located in the east and west of the site, respectively. Asbestos was identified in this sample from WS2 and is characterised as 'Chrysotile – loose fibres. Therefore, as a precautionary measure it is considered appropriate for all development and maintenance personnel to wear the appropriate personal protective equipment and to adopt appropriate health and safety protocols where works below ground level are required. These protocols should include dust suppression during the construction phase.

Due to the localised presence of asbestos within the Made Ground, these materials should not be present at the surface following the completion of the proposed development as they pose a potential risk to future site users. The presence of hardstandings and structures will cut the pathways connecting future site users with asbestos within the Made Ground.

At this stage it is understood that no areas of soft landscaping are proposed within the completed development. However, if landscaped areas are to be incorporated into the development, or should Made Ground be present at the surface, the pollutant linkage involving asbestos can be completed. Therefore it is recommended that a cover layer of 300mm of 'clean' cover soils is placed on an anti-dig barrier comprising either a geotextile or 100mm of crushed concrete in all areas of landscaping forming part of the proposed development.

None of the remaining contaminants of concern are recorded in excess of their relevant screening criteria assuming a commercial land-use. No further assessment of the potential risk to human health within the proposed buildings or car park areas is considered necessary. No remediation of soil is considered necessary to be protective of human health in these parts of the site.

The chemical laboratory test results within this report should be forwarded to the mains water service provider to ensure that their requirements for service line construction on brownfield sites are satisfied.

13 CONTAMINATION ASSESSMENT – CONTROLLED WATERS

The intrusive investigation has not identified elevated concentrations of contaminants of concern. Organic contaminants have only been identified locally marginally in excess of their relevant laboratory detection limits.

The Envirocheck report indicates the site to be located in an area where naturally occurring concentrations of arsenic, cadmium, chromium, lead and nickel are <15mg/kg, <1.8mg/kg, 60-90mg/kg, >900mg/kg and 15-30mg/kg, respectively. The recorded concentrations of these contaminants at the site are broadly consistent with the maximum naturally occurring concentrations detailed in the Envirocheck report.

The site is indicated to be underlain by unproductive strata and is not located within a groundwater Source Protection Zone. There are no groundwater abstractions within 0.5km of the site. In addition, the proposed development comprises structures and hardstandings across the entire site which will limit the potential for leaching of contaminants from the soils present onsite. Therefore, the potential risk posed to groundwater is considered to be very low.

No further assessment of the potential risk to controlled waters from contamination present in soil is considered necessary. No remediation of soils to be protective of controlled waters is considered necessary.

14 WASTE

Based on the results of the chemical laboratory analysis, the Made Ground materials present at the site may be classified as hazardous due to the presence of asbestos and should be considered as such until further testing is completed to prove otherwise.

The natural soils encountered at the site may be classified as inert subject to completion of chemical testing of these materials and appropriate Waste Acceptance Criteria testing as necessary.

Prior to disposal, the characteristics of any excavated soils will need final classification in consultation with the relevant waste disposal facility and further testing and analysis may be required on the actual materials requiring off-site disposal.

Where possible it is recommended that the Made Ground and natural materials are segregated to avoid all materials requiring off-site disposal being classified as hazardous waste.

15 DISCOVERY STRATEGY

This investigation has not identified any significant contamination though not all of the site has been subjected to intrusive investigation. There is the potential for potentially contaminated materials, differing ground conditions or buried structures to be present either beneath these structures or between investigation locations. Should any of these conditions be identified during the development works, ASL should be contacted immediately to allow further assessment to be completed.

This assessment may take the form of additional intrusive investigation, sampling and laboratory analyses subject to the nature of the conditions encountered.

16 CONCLUSIONS AND RECOMMENDATIONS

A desk study and ground investigation has been completed at the site, to characterise the ground and groundwater conditions. A geotechnical and contamination assessment has been completed based on the results of these investigations. The conclusions of this assessment are summarised as follows:

It is considered that conventional foundations could be placed within the cohesive London Clay Formation materials, at a depth of approximately 2.0m to 2.5m bgl, designed to a net allowable bearing pressure of 75kN/m² to limit total settlements to 25mm and differential settlements to acceptable levels.

However due to the high anticipated loads associated with the proposed development it is considered that a piled foundation will need to be adopted, with piles transferring structural loads into the deeper London Clay Formation strata at depth beneath the site.

It is recommended that further deeper intrusive investigation is undertaken post demolition to confirm the nature of the deeper strata to provide the required geotechnical information for pile design.

Due to the presence of significant thicknesses of Made Ground and possible Alluvium materials across the site area it is recommended that a suspended floor slab, with suitable floor void is adopted for the proposed development.

Based on the results of chemical laboratory testing undertaken on samples recovered from the Made Ground and possible Alluvium, it is considered that a Design Sulphate Class "DS-3" and an Aggressive Chemical Environment for Concrete (ACEC) site classification "AC-3" should be adopted for all concrete placed in contact with these materials, such as foundations, piles and services.

The results of chemical laboratory testing undertaken on samples recovered from the London Clay Formation materials it is considered that a Design Sulphate Class "DS-5" and an Aggressive Chemical Environment for Concrete (ACEC) site classification "AC-5" should be adopted for all concrete placed in contact with materials.

If a piled foundation solution is to be adopted it is considered that a Design Sulphate Class "DS-4" (based on water soluble sulphate) and an Aggressive Chemical Environment for Concrete (ACEC) site classification "AC-4" could be adopted for all concrete placed in contact with materials, such as piles.

Based on the results of ground gas monitoring the incorporation of specific gas protection measures are not required for the proposed development. This conclusion should be agreed with the relevant regulatory authorities prior to the commencement of development works to confirm that the assessment completed meets with their requirements and further monitoring to verify these results is not required.

The contamination assessment with respect to human health and controlled waters has not identified a potential risk to the critical receptors. No further assessment of the potential risk to human health or controlled waters is considered necessary. No remediation of soils to be protective of human health or controlled waters is considered necessary.

If areas of soft landscaping are to be incorporated into the proposed development a cover layer comprising 300mm of imported 'clean' growing media together with an anti-dig barrier should be installed.

The chemical laboratory test results within this report should be forwarded to the mains water service provider to ensure that their requirements for service line construction on brownfield sites are satisfied.

It is recommended that an asbestos survey is completed prior to commencement of the development works.

The Made Ground materials present at the site may be classified as hazardous due to the presence of asbestos and should be considered as such until further testing is completed to prove otherwise. The natural soils encountered at the site may be classified as inert subject to completion of chemical testing of these materials and appropriate Waste Acceptance Criteria testing as necessary.

GENERAL NOTES

The interpretation made in this report is based on the information obtained during the course of the desk study and ground investigation. It should be appreciated that any desk study information is not necessarily exhaustive and that further information relevant to the site and its proposed usage may be available. There may be conditions present on the site that have not been revealed by the ground investigation which as a result have not been addressed within this report.

The accuracy of any map extracts cannot be guaranteed and it should be recognised that different conditions on site may have existed between and subsequent to the various map surveys.

The qualitative assessment of risk presented in this report presents an assessment of potential pollutant linkages between sources, pathways and receptors. A level of risk is attributed to these linkages. However a low or insignificant risk does not imply that elevated concentrations of various determinants are not present on the site when compared to background or 'greenfield' conditions.

The level of risk attributed is based on a number of factors and the interpretation of this risk may be applied in a different manner for a different end use or environmental setting. The presence of contaminants may be assessed in alternative ways by institutional bodies regardless of whether an apparent risk is present based on the identified pollutant linkages in this assessment.

This report may express an opinion on possible configurations of strata underlying the site between or beyond the exploratory holes or on the possible presence of features based on either visual, verbal or published evidence, this is for guidance only and no liability can be accepted for its accuracy.

Comments made on ground conditions are based on the observations made at the time of the investigation works. It should be noted that groundwater levels may vary due to seasonal fluctuation or other factors. Observations made with respect to below ground gas concentrations may also vary due to seasonal factors and atmospheric conditions.

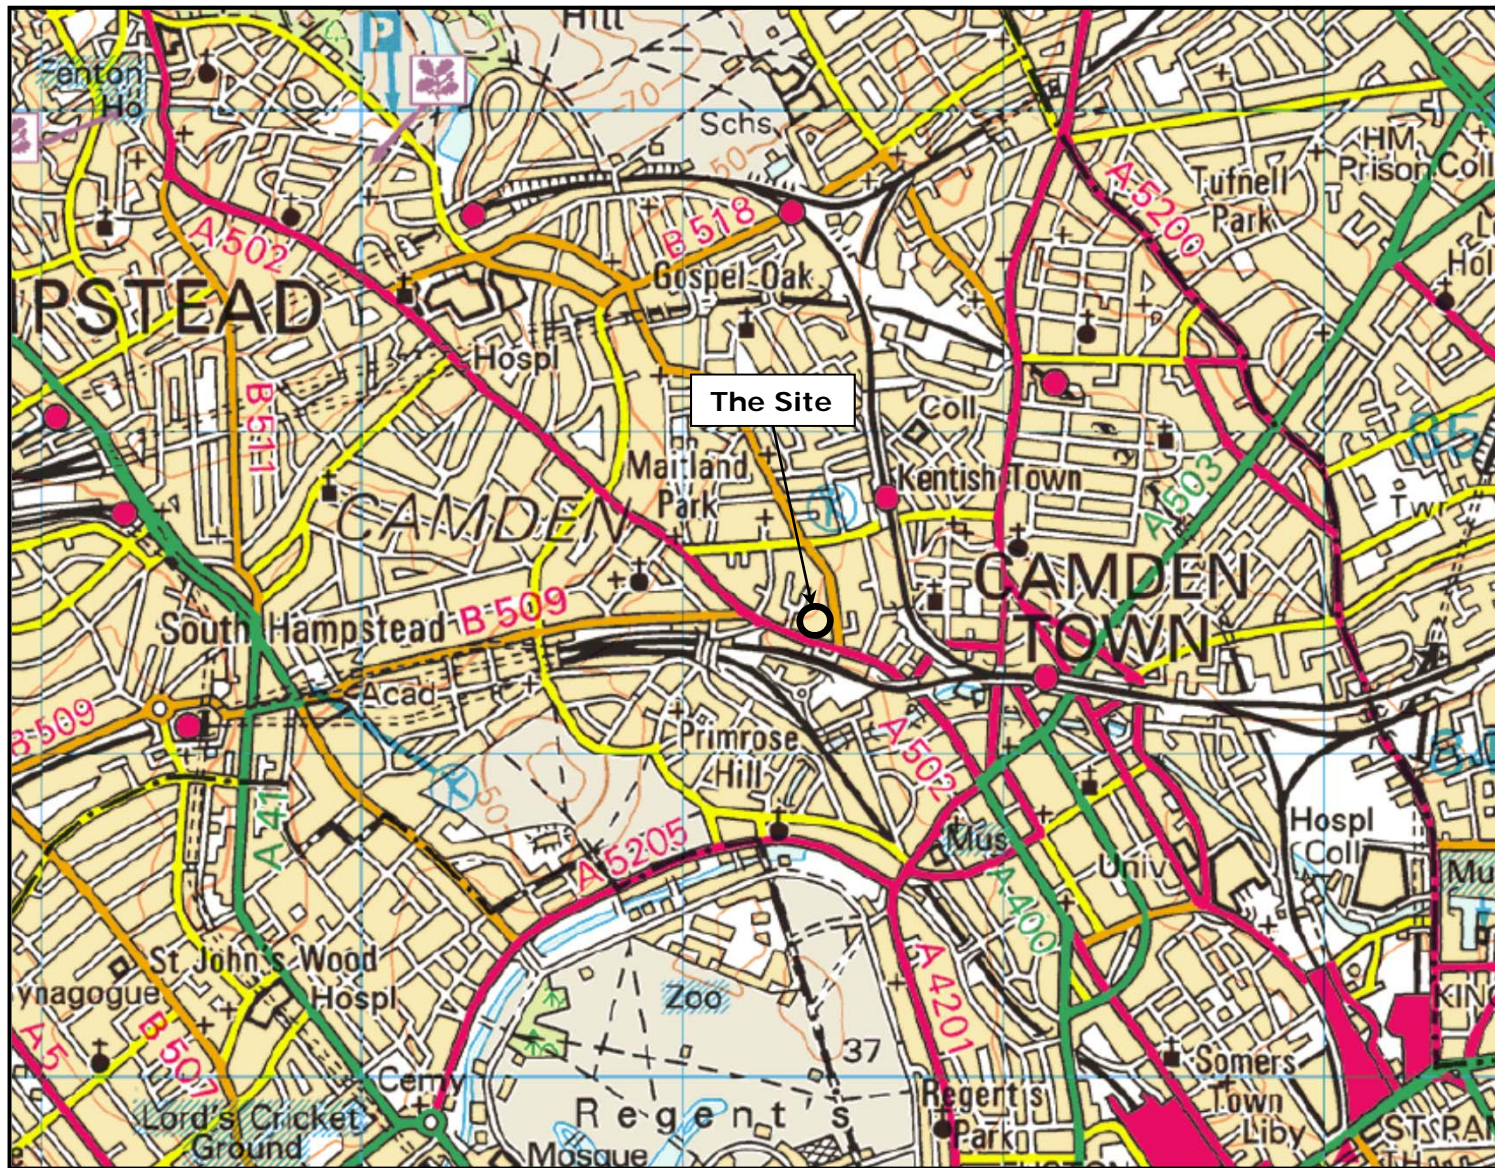

This report has been prepared in relation to the proposed development as detailed herein. Should the nature of the development change following the submission of this report a re-assessment of the conditions recorded on the site may be necessary.

This report may not be used in the assessment of the conditions at any site other than the site described herein

This report has been prepared for the sole use of the client and the client's agents and advisors in relation to the proposed development as detailed herein. The issue of this report to third parties not involved in the proposed development as described herein is not permitted without the prior permission being received in writing by ASL. Reproduction of this report to include all figures, drawings and appendices is prohibited without the prior written consent of ASL.

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination. For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client.

In the attached datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination.

For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client.

In the attached datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

London

Published 1875

Source map scale - 1:2,500

The historical maps shown here were reproduced from maps predominantly held in the archives for England, Wales and Scotland in 1940. In 1940, 1854 and 1:2,500 scale maps were reproduced for the Ordnance Survey. It covered the whole of what was considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held in the archives for England, Wales and Scotland in 1916. The maps were published in 1916 for the Ordnance Survey, and by 1996 it covered the whole of what was considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938 all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Ordnance Survey Plan Published 1963 - 1966

Source map scale - 1:1,250

The historical maps shown here were reproduced from maps predominantly held in the archives of the Ordnance Survey in the United Kingdom in 1940, 1954 and 1966. The maps were scanned and digitised by the Ordnance Survey in 1996. It is important to note that the maps shown here are not the original maps but are reproductions of what were considered to be the calibrated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938 all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Supply of Unpublished Survey Information

Published 1973 - 1974

Source map scale - 1:1,250

SUSI maps (Supply of Unpublished Survey Information) were produced between 1972 and 1977, mainly for internal use at Ordnance Survey. These maps are a by-product of the progress of the national cadastral survey programme. These maps were published, and they do not represent a single moment in time. They were produced at both 1:2,500 and 1:1,250 scales.

Additional SIMs

Published 1980 - 1986

Source map scale - 1:1,250

The SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') are (unlike aerial photography) maps which were produced and published in 1947 to be used by the Ordnance Survey for the production of maps. The data from 1947 to 1994, and contain detailed information on buildings, roads and land-use. These maps were produced at both 1:2,500 and 1:1,250 scales.

10k Raster Mapping

Published 2006

Source map scale - 1:10,000

The historical maps shown were produced from the Ordnance Survey's 1:10,000 scale maps for the area. These maps are for the period 1970-1999, which are available at 1:10,000 scale. The maps are highly detailed showing buildings, fences and field boundaries as well as all roads, tracks and paths. Road names are also included together with the relevant road number and classification. Boundary information depiction includes county, unitary authority, district, civil parish and constituency.

**VectorMap Local
Published 2015**

Source map scale - 1:10,000

VectorMap Local (Raster) is Ordnance Survey's highest detailed 'backdrop' mapping product. These maps are produced from OS's VectorMap Local, a vector map of Great Britain, that has been designed for creating graphical overlays. OS VectorMap Local is derived from large-scale information surveyed at 1:250 scale (covering major towns and cities), 1:2500 scale (smaller towns, villages and developed rural areas), and 1:10,000 scale (mountain, moorland and river estuary areas).

* These descriptions are only intended to act as a cross check if sample identities are questioned. The major constituent of the sample is intended to act with respect to MCERTS validation. The laboratory is accredited for sand, clay and loam (MCERTS) soil types. Data for unaccredited types of solid should be interpreted with care.

Stone content of a sample is calculated as the % weight of the stones not passing a 10 mm sieve. Results are not corrected for stone content.

Lab Sample Number	Sample Reference	Sample Number	Depth (m)	Sample Description *
452062	WS1	ES2	0.80	Light brown clay and sand with rubble and brick.
452063	WS2	ES1	0.50	Light brown clay and sand with rubble and brick.
452064	WS3	ES4	1.50	Brown clay and loam.
452065	WS3	D10	3.60	Light brown clay.
452066	WS2	D7	2.50	Light brown clay.
452067	WS1	ES4	1.60	Brown clay and loam.

Water matrix abbreviations: Surface Water (SW) Potable Water (PW) Ground Water (GW)

Analytical Test Name	Analytical Method Description	Analytical Method Reference	Method number	Wet / Dry Analysis	Accreditation Status
Ammonium as NH ₄ in soil	Determination of Ammonium/Ammonia/Ammoniacal Nitrogen by the colorimetric salicylate/nitroprusside method.	In-house method based on Examination of Water and Wastewater 20th Edition: Clesceri, Greenberg & Eaton	L082-PL	W	MCERTS
Asbestos identification in soil	Asbestos Identification with the use of polarised light microscopy in conjunction with disperion staining techniques.	In house method based on HSG 248	A001-PL	D	ISO 17025
Boron, water soluble, in soil	Determination of water soluble boron in soil by hot water extract followed by ICP-OES.	In-house method based on Second Site Properties version 3	L038-PL	D	MCERTS
Chloride, water soluble, in soil	Determination of Chloride colorimetrically by discrete analyser.	In-house method based on BS1377 Part 3, 1990, Chemical and Electrochemical Tests. 2:1 extraction.	L082-PL	D	MCERTS
Elemental sulphur in soil	Determination of elemental sulphur in soil by extraction in dichloromethane followed by HPLC.	In-house method based on Secondsite Property Holdings Guidance for Assessing and Managing Potential	L021-PL	D	NONE
Fraction of Organic Carbon in soil	Determination of fraction of organic carbon in soil by oxidising with potassium dichromate followed by titration with iron (II) sulphate.	In-house method based on BS1377 Part 3, 1990, Chemical and Electrochemical Tests	L023-PL	D	NONE
Free cyanide in soil	Determination of free cyanide by distillation followed by colorimetry.	In-house method based on Examination of Water and Wastewater 20th Edition: Clesceri, Greenberg & Eaton (Skalar)	L080-PL	W	NONE
Hexavalent chromium in soil	Determination of hexavalent chromium in soil by extraction in water then by acidification, addition of 1,5 diphenylcarbazide followed by colorimetry.	In-house method	L080-PL	W	MCERTS
Magnesium, water soluble, in soil	Determination of water soluble magnesium by extraction with water followed by ICP-OES.	In-house method based on TRL 447	L038-PL	D	NONE
Metals in soil by ICP-OES	Determination of metals in soil by aqua-regia digestion followed by ICP-OES.	In-house method based on MEWAM 2006 Methods for the Determination of Metals in Soil.	L038-PL	D	MCERTS
Moisture Content	Moisture content, determined gravimetrically.	In-house method based on BS1377 Part 3, 1990, Chemical and Electrochemical Tests	L019-UK/PL	W	NONE
Monohydric phenols in soil	Determination of phenols in soil by extraction with sodium hydroxide followed by distillation followed by colorimetry.	In-house method based on Examination of Water and Wastewater 20th Edition: Clesceri, Greenberg & Eaton (skalar)	L080-PL	W	MCERTS
pH in soil (automated)	Determination of pH in soil by addition of water followed by electrometric measurement.	In-house method based on BS1377 Part 3, 1990, Chemical and Electrochemical Tests	L099-PL	D	MCERTS
Speciated EPA-16 PAHs in soil	Determination of PAH compounds in soil by extraction in dichloromethane and hexane followed by GC-MS with the use of surrogate and internal standards.	In-house method based on USEPA 8270	L064-PL	D	MCERTS
Stones content of soil	Standard preparation for all samples unless otherwise detailed. Gravimetric determination of stone > 10 mm as % dry weight.	In-house method based on British Standard Methods and MCERTS requirements.	L019-UK/PL	D	NONE
Sulphate, water soluble, in soil	Determination of water soluble sulphate by ICP-OES. Results reported directly (leachate equivalent) and corrected for extraction ratio (soil equivalent).	In-house method based on BS1377 Part 3, 1990, Chemical and Electrochemical Tests, 2:1 water:soil extraction, analysis by ICP-OES.	L038-PL	D	MCERTS
Sulphide in soil	Determination of sulphide in soil by acidification and heating to liberate hydrogen sulphide, trapped in an alkaline solution then assayed by ion selective electrode.	In-house method	L010-PL	D	MCERTS

ISS No 15-73098-1

Analytical Report Number : 15-73098

Project / Site name: Ferdinand Street, London

Water matrix abbreviations: Surface Water (SW) Potable Water (PW) Ground Water (GW)

Analytical Test Name	Analytical Method Description	Analytical Method Reference	Method number	Wet / Dry Analysis	Accreditation Status
Total cyanide in soil	Determination of total cyanide by distillation followed by colorimetry.	In-house method based on Examination of Water and Wastewater 20th Edition: Clesceri, Greenberg & Eaton (Skalar)	L080-PL	W	MCERTS
Total sulphate (as SO4 in soil)	Determination of total sulphate in soil by extraction with 10% HCl followed by ICP-OES.	In-house method based on BS1377 Part 3, 1990, Chemical and Electrochemical Tests	L038-PL	D	ISO 17025
Total Sulphur in soil	Determination of total sulphur in soil by extraction with aqua-regia, potassium bromide/bromate followed by ICP-OES.	In-house method based on BS1377 Part 3, 1990, and MEWAM 2006 Methods for the Determination of Metals in Soil	L038-PL	D	NONE
TPH1 (Soil)	Determination of TPH by GC-MS/GC-FID).	In-house method	L064/076PL	D	MCERTS
Water Soluble Nitrate (2:1) as N in soil	Determination of nitrate by reaction with sodium salicylate and colorimetry.	In-house method based on Examination of Water and Wastewater & Polish Standard Method PN-82/C-04579.08, 2:1 extraction.	L078-PL	D	NONE

For method numbers ending in 'UK' analysis have been carried out in our laboratory in the United Kingdom.

For method numbers ending in 'PL' analysis have been carried out in our laboratory in Poland.

Soil analytical results are expressed on a dry weight basis. Where analysis is carried out on as-received the results obtained are multiplied by a moisture correction factor that is determined gravimetrically using the moisture content which is carried out at a maximum of 30°C.
