

Extensive Sedum Blanket

Bauder Xero Flor extensive green roof systems are constructed using a low maintenance sedum planting (succulents) that provide excellent cover and increased protection to the waterproofing system. The plants are grown on a 'blanket' that is harvested like turf and installed by rolling out on top of the waterproofing and any other landscaping components required. The blankets are very lightweight, easy to maintain and provide instant greening to the roof

The Xero Flor sedum blanket is a very versatile, exceptionally lightweight green roof system and is suitable for both new build and refurbishment projects.

It should be noted that extensive green roof systems are not intended for general access or leisure purposes and are primarily used for their ecological benefits or aesthetic appearance.

KEY FEATURES

These features are in addition to those associated with all green roofs

The most lightweight green roof system available, making it ideal for retrofitting or refurbishment projects.

Delivers instant greening of a roof with sedums and other species able to flourish in our climate.

Ideal solution where a green roof needs to be specified to meet planning
