Executive Summary / Non-technical Summary			
	The London Borough of Camden requires a Basement Impact Assessment (BIA) to be prepared for developments including basements and light wells within its area of responsibility. CGP4 – Basements and Light wells details the requirements for a BIA undertaken in support of proposed developments; in summary the Council will only allow basement construction to proceed if it does not:		
	<ul> <li>Cause harm to the built environment and local amenity;</li> <li>Result in flooding;</li> <li>Lead to ground instability.</li> </ul>		
	In order to comply with the above clauses a BIA must undertake 5 stages detailed in CPG 4. This report has been produced in line with the guidance of CPG4 and the associated documents supporting CGP4 such as DP23, DP26, DP25 & DP27.		
Project Description of Property			
Summary	The existing site has a series of garages that will be demolisheed to give way for new basement and new two storeys on top of basement.		
	Proposed Works		
The proposed works require the construction of:			
	<ul> <li>A new basement and a new two storey dwelling above basement.</li> <li>Light wells to the front and rear</li> <li>Superstructure works above the basement <ul> <li>New two storey dwelling above basement.</li> </ul> </li> </ul>		
	Croft Structural Engineers Ltd has extensive knowledge of constructing new basements. Over the last 10 years Croft Structural Engineers has been involved in the design of over 500 basements in and around London. The method to be utilised at 1B ST JOHNS WOOD PARK is:		
	1. Excavate front to allow for conveyor to be erected.		
	2. Safely and securely support the existing building above		
	3. Form lightwell with cantilevered retaining walls		

	<ol> <li>Slowly work from the front to the rear inserting narrow cantilevered retaining walls sequentially using well developed and understood underpinning methods.</li> <li>Prop retaining walls in temporary condition back to the central soil "dumpling".</li> <li>Prop across the width of the basement, excavate central soil "dumpling" &amp; cast basement slab</li> <li>Waterproof internal space with a drained cavity system.</li> </ol>		
Stage 1 – Screening	Screening identified areas of concern and concluded a requirement to proceed to a scoping stable for the Land stability, Hydrology, Surface Water and flooding.		
Stage 2 – Scoping	The Scoping stage identified the potential impacts and set the parameters required for further study of the areas of concern highlighted in the Screening phase. A walk over desk survey completed by an engineer. The information from this was utilised to formulate the requirement for a ground, Geology and hydrogeology investigation.		
Stage 3 – Site investigation and study	<ul> <li>A Structural engineer inspected the building to determine the current condition of the property.</li> <li>Visual inspections were completed of the adjacent properties to determine if there were signs of structural movement.</li> <li>The neighbouring land has not been excavated on but an engineer has assessed the age of the adjacent properties and considered the type of foundations used for that period and assumed these in the design.</li> <li>A ground investigation with 12.5m deep boreholes has been completed. <ul> <li>The formation level of the basement will be in London Clay</li> <li>Initial standpipe readings did not encounter any water</li> </ul> </li> <li>Laboratory testing was undertaken on the soil samples.</li> <li>Ground water has been measured over repeat visits to determine water levels and flows.</li> <li>A repeat observed water at 0.5m below ground level</li> </ul>		

Stage 4 -

## Land stability

The Geologist has concluded that the basement will not make the area unstable.

The movement assessment of the basement and its construction are SLIGHT 1-0 on the Burland scale.

#### It has been concluded that

The boreholes records have indicated the presence possible perched groundwater to a depth of 0.49 m bgl. However if groundwater is recorded during the construction works it anticipated that any inflow will be very modest, on the basis of the ground conditions encountered. The groundwater would be controlled by pumping to a tank prior to disposal by tanker to an approved facility. Alternatively discharge of the groundwater could be made to the sewer subject to an agreement from the local water company in terms of water quality, flow rate and quantity.

Groundwater levels should be continued to be monitored before, during and after construction. Monitoring of adjacent structures and the highway should be carried out before, during and after construction.

#### Hydrogeology

It is understood that the basement retaining walls will be a contiguous piled wall. Therefore excavation for the basement will be protected from instability by the piled wall. Excavation of the basement area will need to comply with appropriate health and safety criteria in terms of height and width of excavation face.

#### Drainage & Surface Water Flow

The risk of flooding from excess surface water is not considered to be significant.

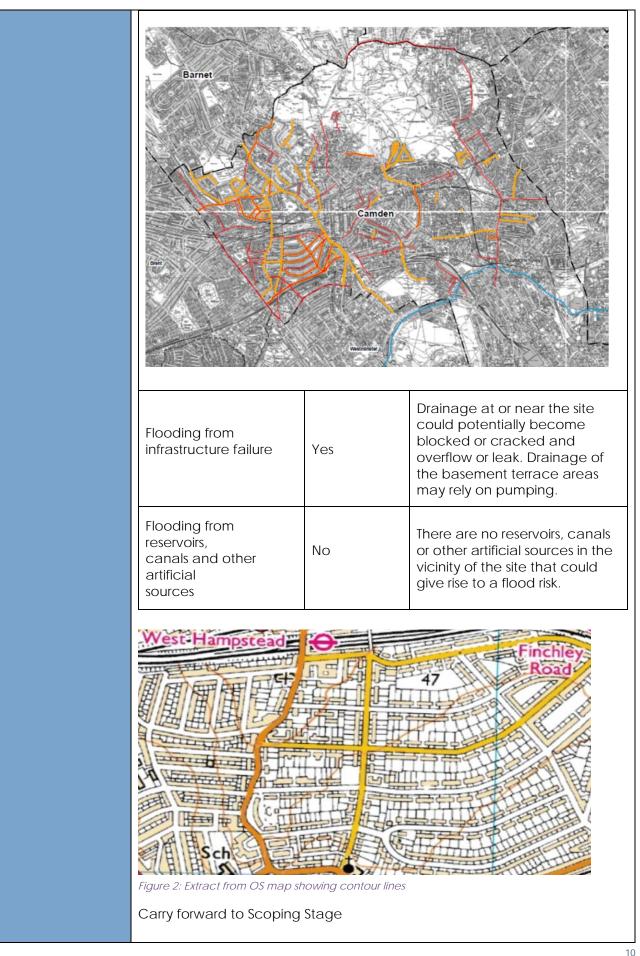

1. Screening Stage		
	This stage should identify any areas for concern and therefore focus effort for further investigation.	
	The questions below are taken from the Camden CPG 4 – Basements and Lightwells.	
Land Stability	Refer to Chartered Geologist Report.	
Subterranea n Flow	Refer to Chartered Hydrogeologist report completed by A Hydrogeologist with the "CGeol" (Chartered Geologist) qualification from the Geological Society of London.	
Surface Flow and Flooding		
	Question 1: Is the site within the catchment of the pond chains on Hampstead Heath?	
	Figure 1: Extract from Figure 14 of the Hydrological Study No. The site lies outside the areas denoted by figure 14 of the Arup report.	

Question 2. As part of the proposed site drainage, will surface water flows(e.g. volume of rainfall and peak run-off) be materially changed from theexisting route?Due to the construction of the garden basement and the rear lightwell, theflow of water into the ground and the existing surface water drainagesystem may change.Carry forward to scoping.Question 3. Will the proposed basement development result in a change to		
the hard surfaced /paved external areas? Due to the construction of the garden basement the hard surface/paved external areas may change.		
Question 4. Will the proposed basement result in changes to the inflows (instantaneous and long term of surface water being received by adjacent properties or downstream watercourses? No. The proposed development will enter the current drainage system.		
Question 5. Will the proposed basement result in changes to the quality ofsurface water being received by adjacent properties or downstreamwatercourses?No. The quality of water is unlikely to be altered.		
Question 6 : IS the site in an area identified to have surface water flood risk according to either the Local Flood Risk Management Strategy or the Strategic Flood Risk Assessment or is it at risk from flooding, for example because the proposed basement is below the static water level of nearby surface water feature?The potential sources of flooding are summarised below:		
Potential Source	Potential Flood Risk At Site?	Justification
Fluvial flooding	No	EA Flood Mapping shows Flood Zone 1. Distance from nearest surface watercourse >1km
Tidal flooding	No	Site location is 'inland' and topography > 40mAOD.
Flooding from rising / high groundwater	No	Site is located on low permeability London Clay.
Surface water (pluvial) flooding	Yes	The 1B ST JOHNS WOOD PARK is noted on the flood street list and maps from 1975 or 2002 (shown graphically below)

W:\Project File\Project Storage\2015\150607-St Johns Wood Park\2.0.Calcs\BIA\St Johns Wood Park Camden Basement Impact Assessment.docx

2. Scoping Stage		
	Identifies the potential impacts of the areas of concern highlighted in the Screening phase.	
Land Stability	Refer to Chartered Geologist Report.	
Subterranea n Flow	Refer to Chartered Hydrogeologist report. Completed by A Hydrogeologist with the "CGeol" (Chartered Geologist) qualification from the Geological Society of London.	
Surface Flow	Conceptual Model	
& Flooding	The proposed works at 1B ST JOHNS WOOD PARK require new basement and new two storey dwelling above basement.	
	The basement is under the footing print of the property which will not affect the overall flow.	
	Lightwells increase the hardstanding slightly which may increase flow.	
	Question 1: Is the site within the catchment of the pond chains on Hampstead Heath?	
	<b>No</b> further info required from Scoping stage	
	Question 2. As part of the proposed site drainage, will surface water flows (e.g. volume of rainfall and peak run-off) be materially changed from the existing route?	
	<b>No</b> . Due to the construction of the garden basement and the rear lightwell,	
	the flow of water into the ground and the existing surface water drainage system may change. Carry forward to scoping.	
	Question 3. Will the proposed basement development result in a change to the hard surfaced /paved external areas?	
	Unknown Due to the construction of the garden basement the hard	
	surface/paved external areas may change.	
	Question 4. Will the proposed basement result in changes to the inflows (instantaneous and long term) of surface water being received by adjacent	
	properties or downstream watercourses?	
	<b>Unknown</b> – The light wells may reduce the impermeable areas. Carry forward to Site Investigation & desk Study	

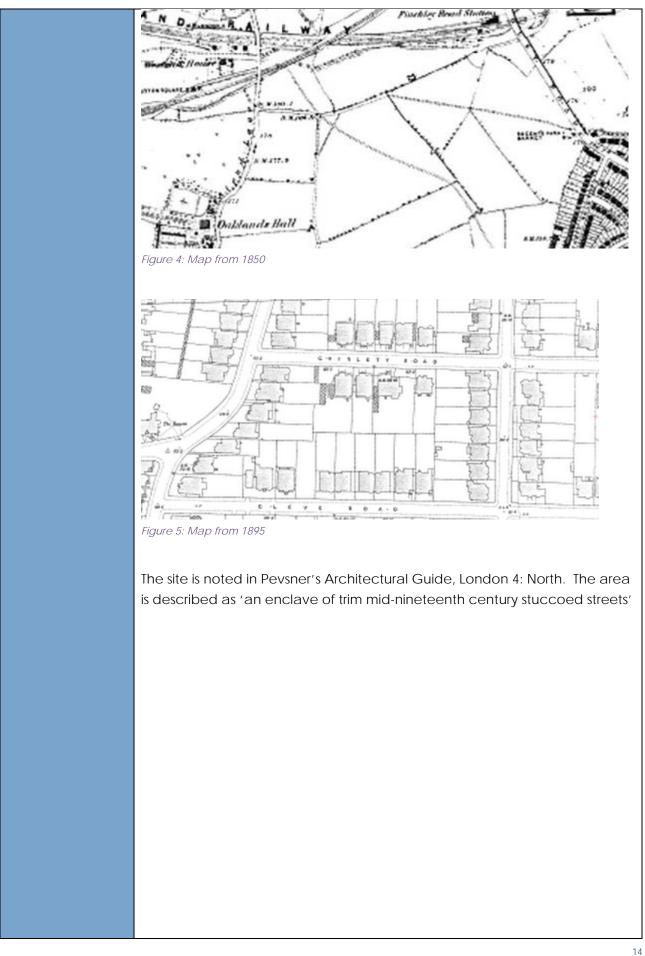

Question 5. Will the proposed basement result in changes to the quality of surface water being received by adjacent properties or downstream watercourses? No.
Question 6 : Is the site in an area identified to have surface water flood risk according to either the Local Flood Risk Management Strategy or the Strategic Flood Risk Assessment or is it at risk from flooding, for example because the proposed basement is below the static water level of nearby surface water feature?
It is evident from the screening study that the only significant flood risks at 1B ST JOHNS WOOD PARK are due surface water (pluvial) flooding and failure of existing sewers in the vicinity of the site.
Carry forward to Site Investigation & Desk Study

3. Site Inve	estigation and Study
	Identifies the relevant features of the site and its immediate surroundings providing further scoping where required.
	Desk Study and Walkover Survey The existing site has a series of garages that will be demolisheed to give way for new basement and new two storeys on top of basement. Noma Manzini, a Structural Engineer from Croft Structural Engineers visited 1B ST JOHNS WOOD PARK. Date of inspection was on the 16 <sup>th</sup> of June 2015
Proposed Development	<text></text>
Site History	What was the previous usage of the site?

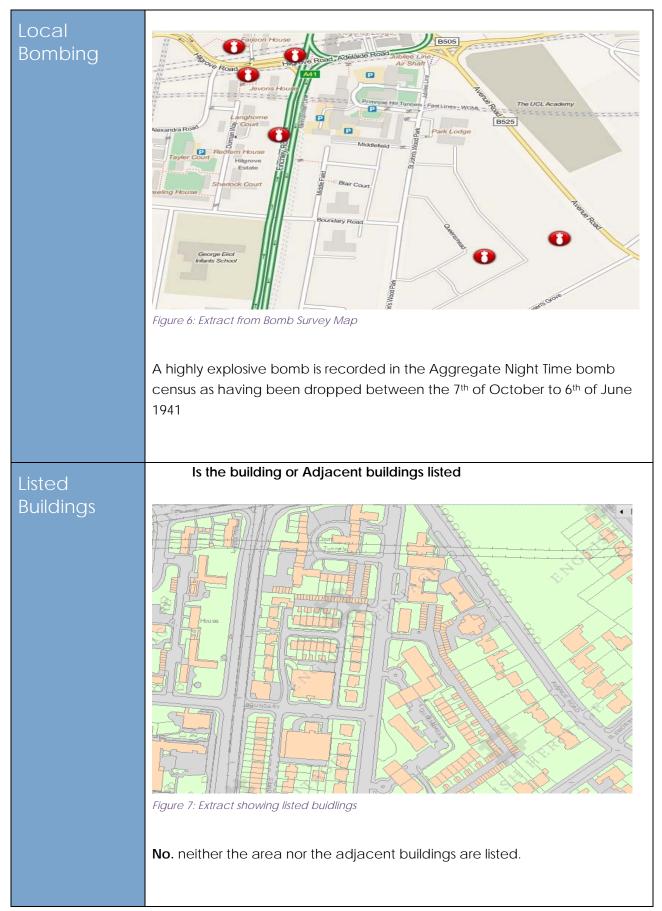

Job Number: 150607 (St Johns Wood Park) Date: 17 Jul 2015

W:\Project File\Project Storage\2015\150607-St Johns Wood Park\2.0.Calcs\BIA\St Johns Wood Park Camden Basement Impact Assessment.docx

	Highways, Rail and London Underground
	<b>Yes.</b> Site is within 5m of the footpath/alleyway and the road surface is further than 5m from the front lightwell.
London Underground and Network Rail	<text><text><figure></figure></text></text>
UK Power Networks	Will the basement works affect any UK Power Network Assets? No, there no significant items of electrical infrastructure (such as pylons or
	substations) in the immediate vicinity
Vicinity of Trees	Some mature trees and general vegetation in the neighbouring garden; A mature tree is also present in the neighbouring garden. There are trees close by with have tree presentation orders. These are across the road and are not present in the neighbouring gardens.

Job Number: 150607 (St Johns Wood Park) Date: 17 Jul 2015

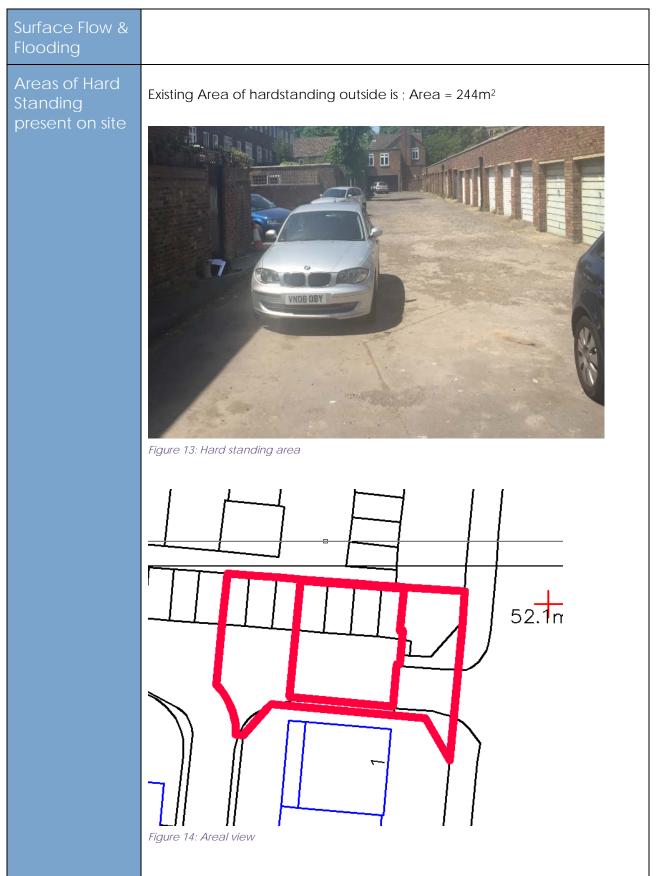

Nos 1 Middlefield – Property to Rear	Property Age : Victorian Property use :Residential Number of storeys : 2 Is a basement present? :No Structural Defects Noted: No structural defects noted externally by visual inspection.
	Fgre 12: 1 Middlefield
Local Topography	As mentioned previously, the area surrounding the property has a general slope, downwards from north-west to south-east. The slope is gradual; there are no retaining walls for sudden changes in elevation
Ground Investigation	A ground investigation see separate report.
Geology	See Ground investigation report and Geology report

Rainwater down pipes, Drains, Manholes and Gulleys	As described previously, there is a surface water drainage gully in the front yard and pea-shingle drainage in the rear yard.
Local Water Sources	Are there any ponds lakes or water courses on the site or adjacent sites? No, there are not surface water features (natural or man-made) on the adjacent sites.
	Field Investigation
	Ground investigation specialists visited the site and subsequently produced are report for the existing ground and groundwater conditions.
	Monitoring, Reporting and Investigation
	The ground investigation report, which has data from initial site investigations and data from subsequent monitoring, is available as a separate report. Data relevant to land stability and subterranean flow is examined separate documents as described below.
Land Stability	Refer to Chartered Geologist Report for land stability issues addressed to Stage 3.
	Features and items of concern relating to data from Stage 3 are included in this report.
Subterranean Flow	Refer to Chartered Hydrogeologist report (Basement Impact Assessment: Groundwater). This is completed by a Hydrogeologist with the "CGeol" (Chartered Geologist) qualification from the Geological Society of London.
	Features and items of concern relating to data from Stage 3 are included in this report.

Г

Site Investig	gation
Soil investigation Brief	The Soil investigation was completed by (Ground and Water).
	From the Scoping stage we considered that their brief should cover:
	• Two trial pits to the side and rear to confirm the existing foundations of existing garages. The purpose is to consider the effect of the works on the neighbouring properties and the find the ground conditions below the site.
	<ul> <li>Bore holes to a depth of 12.5m below ground level (i.e. approximately more than twice the depth of the proposed basement).</li> </ul>
	<ul> <li>Stand pipe to be inserted to monitor ground water; record initial strike and the water level after 1 month.</li> </ul>
	<ul> <li>Site testing to determine insitu soil parameter. SPT testing to be undertaken.</li> </ul>
	<ul> <li>Laboratory testing to confirm soil make up and properties.</li> </ul>
	<ul> <li>The Historic maps and walk over survey did not highlight any significant contamination sources, therefore no site test of the ground has been requested.</li> </ul>
	Factual Report on soil conditions.
	Interpretative reports
	Calculation of bearing pressures from SPT.
	• Indication of $\emptyset$ (angle of friction) from SPT.
	Indication of soil type
	Soil Report is provided under a separate cover.

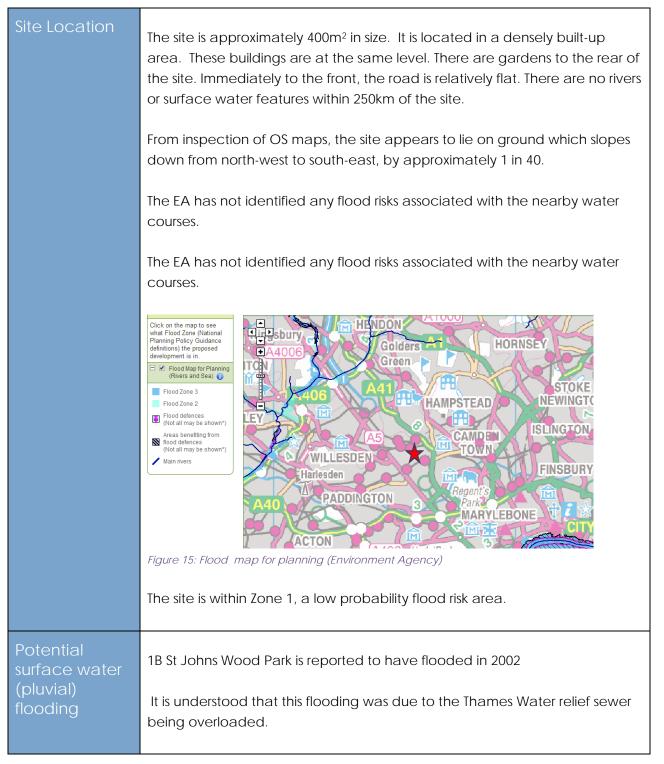

4. Basemer	nt Impact Assessment
Subterranean Flow	Refer To Hydrogeologist report : Conclusions re stated in the Executive Summary
Land Stability	Refer to Geologist Report: Conclusions restated in the Executive Summary
Conservation and Listed Buildings	If the property is in a conservation area, or it is listed then management plan for demolition and construction may be needed. This is not included with this BIA document and is not within the Croft Structural Engineers Brief.

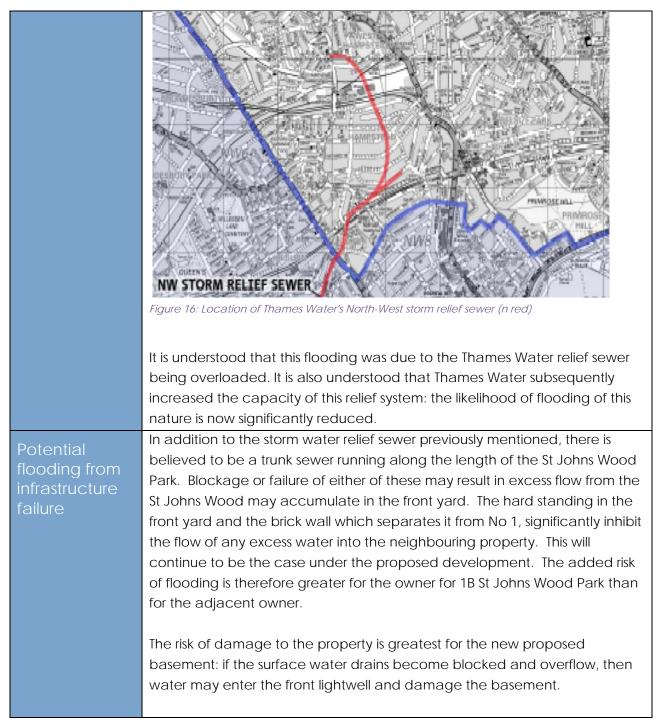

Flood Risk Ass	essment
	<ul> <li>In accordance with guidance from CIRIA, PPS25 and the National Planning Policy Framework, the basement will be designed to be sustainable in terms of the risk of flooding. Amongst other considerations, the design will include provisions to minimise the adverse impacts of flooding on the operation of the building, the users, the surroundings and the occupants of nearby properties. These design measures must be preceded by a Flood Risk Assessment (FRA), and is staged as follows:</li> <li>A screening study to identify potential sources of flooding and confirm the need for an FRA. This has been carried out in the Section 1.</li> <li>A subsequent scoping study to identify sources of flooding and also other features relevant to flooding. This has been done in the previous sections.</li> <li>An impact assessment with flood risk management options proposed. This is presented in this section.</li> </ul>

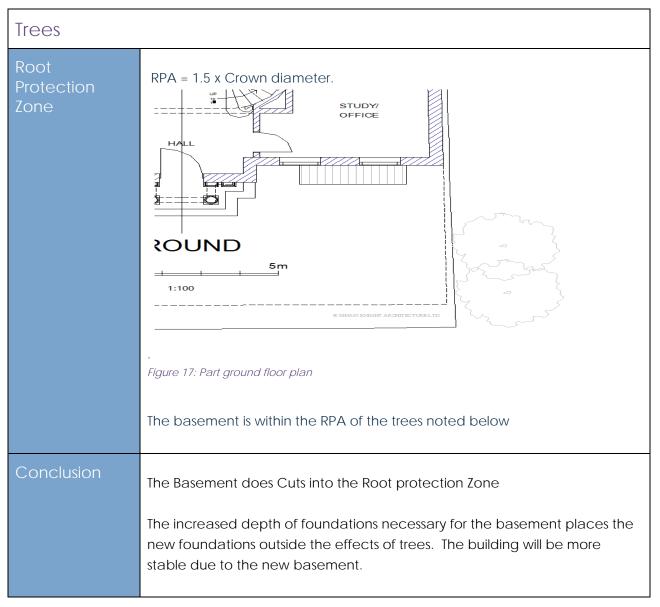

Mitigation	This risk, and the extent of the related damage can be reduced as follows:
measures	<ul> <li>At ground level, an upstand can be constructed around the front lightwell.</li> </ul>
	<ul> <li>A pumping mechanism will be installed for the proposed basement. There is a likelihood that this may fail and allow excess water to accumulate. If this were to occur, the build-up of water would be gradual and noticeable before it becomes a significant life-threatening hazard.</li> </ul>
	<ul> <li>Install a dual pumping system to maintain operation in the event of a failure. This should include a battery backup and a suitable alarm system for warning purposes.</li> </ul>
	<ul> <li>To reduce the impact of surface water flooding, sustainable drainage systems such as on site attenuation should be considered at detailed design stage.</li> </ul>
Summary	The risk of flooding from excess surface water is not considered significant. There is a risk of flooding due to the failure of the pumping system but this
	can be reduced to acceptable levels with appropriate design and
	installation measures.

	With the above the maximum level of cracking anticipated is Hairline cracking which can be repaired with decorative cracking and can be repaired with decorative repairs. Under the party wall Act damage is allowed (although unwanted) to occur to a neighbouring property as long as repairs are suitability undertaken to rectify this. To mitigate this risk The				
				ed and a Party Wall Surveyor will be appointed.	
Burland Scale	Extract from The Institution of Structural Engineers "Subsidence of Low-Rise Buildings" Table 6.2 Classification of visible damage to walls with particular reference to type of repair, and rectification consideration				
	Category of Damage	Approximate crack width	Limiting Tensile strain	Definitions of cracks and repair types/considerations	
	0	Up to 0.1	0.0- 0.05	HAIRLINE – Internally cracks can be filled or covered by wall covering, and redecorated. Externally, cracks rarely visible and remedial works rarely justified.	
	1	0.2 to 2	<u>0.05-</u> <u>0.075</u>	<u>FINE</u> – Internally cracks can be filled or covered by wall covering, and redecorated. Externally, cracks may be visible, sometimes repairs required for weather tightness or aesthetics. NOTE: Plaster cracks may, in time, become visible again if not covered by a wall covering.	
	The antic	ipated dar	nage C	ategory for the new basement is <b>0-1</b>	

Monitoring	
	<b>Monitoring</b> - In order to safeguard the existing structures during underpinning and new basement construction movement monitoring is to be undertaken.

Risk	Monitoring Level proposed	Type of Works.
Assessment	Monitoring 1 Visual inspection and production of condition survey by Party wall surveyors at the beginning of the works and also at the end of the works.	Cross wall removals, insertion of padstones Survey of LUL and Network Rail tunnels. Mass concrete, reinforced and Piled foundations to new build properties
	Monitoring 2 Visual inspection and production of condition survey by Party wall surveyors at the beginning of the works and also at the end of the works. Visual inspection of existing party wall during the works. Inspection of the footing to ensure that the footings are stable and adequate.	Removal of lateral stability and insertion of new stability fames Removal of main masonry load bearing walls. Underpinning works less than 1.2m deep
	Monitoring 3 Visual inspection and production of condition survey by Party wall surveyors at the beginning of the works and also at the end of the works. Inspection of the footing to ensure that the footings are stable and adequate. Vertical monitoring movement by standard optical equipment	Underpinning works less than 3.0m deep in clays Basements up to 2.5m deep in clays
	Monitoring 4 Visual inspection and production of condition survey by Party wall surveyors at the beginning of the works and also at the end of the works.	New basements greater than 2.5m and shallower than 4m Deep in gravels Basements up to 4.5m deep in clays

		on of the footin footings are sta ite.	0	Underpinning works to grade I listed building
Monitoring Conclusion	The level	of Monitoring C	Croft recommen	d on 1B St Johns Wood Park is:

Basement De	sign & Construction Impacts
Foundation type	<ul> <li>Reinforced concrete cantilevered retaining walls</li> <li>The designs for the retaining walls have been calculated using software designed by TEDDS. The software is specifically designed for retaining walls and ensures the design is kept to a limit to prevent damage to the adjacent property.</li> <li>The overall stability of the walls are design using K<sub>a</sub> &amp; K<sub>p</sub> values, while the design of the wall uses K<sub>o</sub> values. This approach minimise the level of movement from the concrete affecting the adjacent properties.</li> <li>The Investigations have highlight that water is a present. The walls are designed to cope with the hydrostatic pressure. The water table was low. The design of the walls however considers the long term items. It is possible that a water main may break causing local high water table. To account for this the wall is designed for water 1m from the top of the wall.</li> <li>The Design also considers floatation as a risk. The design of has considered the weight of the building and the uplift resulting in a stable structure.</li> </ul>
Roads	The basement must be designed for Yes. Site is within 5m of the footpath/alleyway and the road surface is further than 5m from the front lightwell. Highways loading allow: 10kN/m2 if within 45° of road 100kN point loads if under road or with in 1.5m 5kN/m2 if within 45° of Pavement Garden Surcharge 2.5kN/m2 Surcharge for adjacent property 1.5kN/m2 + 4kN/m2 for concrete ground bearing slab Family/domestic use
of structure and user requirements

Lateral Stability				
Exposure and wind loading conditions	Basic wind speed Vb = 21 m/s to E Topography not considered signifi			
Stability Design	The cantilevered walls are suitable above	to carry the late	eral loading applie	ed from
Lateral Actions	The soil loads apply a lateral load	on the retaining	walls.	

	Hydrostatic pressure will be applied to the wall
	Imposed loading will surcharge the wall.
	Design overall stability to $K_a \& K_p$ values. Lateral movement necessary to
Retained soil	achieve $K_a$ mobilisation is height/500 (from Tomlinson). This is tighter than the
Parameters	deflection limits of the concrete wall.
· · · · · · · · · · · · · · · · · · ·	Has a soil investigation been carried out Yes
Water Table	Known water table from boreholes
	Design temporary condition for water table level, If deeper than
	basement ignore
	Design Permanent condition for water table level:
	If deeper than existing, design reinforcement for water table at
	full basement depth to allow for local failure of water mains,
	drainage and storm water.
	Global uplift forces can be ignored when water table lower than
	basement. BS8102 only indicates guidance.
Drainage and	Assumed that drainage and damp proofing is by others: Details are not
Drainage and	provided within our brief.
Damp Waterproofing	
waterprooning	It is recommended that a water proofing specialist is employed to ensure all
	the water proofing requirements are met. Croft structural engineers are not
	the waterproofing designer nor act as the structural waterproof designer.
	Croft are not the structural waterproofer. The waterproofing specialist must
	name who is their structural waterproofer. The Structural waterproofer must
	inspect the structural details and confirm that are happy with the robustness.
	Due to the construction nature of the segmental basement it is not possible
	to water proof the joints. All water proofing must be made by the
	waterproofing specialist. They should make review of our details and
	recommend to us if water bars and stops are necessary.
	The waterproof design must not assume that the structure is watertight. To
	help reduce water floor through joints in the segmental pins all faces should
	be;
	<ul> <li>Cleaned of all debris and detritus</li> </ul>
	<ul> <li>Faces between pins should be needle hammered to improve key</li> </ul>
	<ul> <li>All pipe work and other penetrations should have puddle flanges</li> </ul>
	or hydrophilic strips
Localised	Localised dewater to pins may be necessary.
Dewatering	
3	

	<ul> <li>Some engineers may raise the theoretical questions about pumping of water causing localised settlement. We believe that this argument is a red herring when applied to single storey basements and our reason for stating this is:</li> <li>The water table in the area is variable,</li> <li>The water level naturally rises and falls over time and does not lead to subsidence</li> <li>The water table has naturally been rising and falling for over the last 20,000 years, any fines that will have been removed from the soil would have done so already.</li> <li>If the water table rises and falls naturally why does this not cause subsidence due to fine removals every year? It does not because the soil has been soil is naturally consolidated by the rise and fall of the water table in the area.</li> <li>The effect of local pumping for small excavations will not affect the local area.</li> </ul>
	<ul> <li>There is only a risk of subsidence from large scale pumping of soil which lowers the water table below is natural lowest level.</li> </ul>
Temporary Works	Walls are designed to be temporarily stable. Temporary propping details will be required for the ground and soil and this must be provided by the contractor. Their details should be forwarded to Croft Structural Engineers. Particular attention should be paid to the point loads from above.
	Critical areas where point loads are present from above Cross wall Chimney Stack Door openings
Geological Assessment of Land Stability	Has the retaining wall design been assessed by a Chartered Geological Engineer? Yes inspected see supplementary report.

Eccentricity of reaction	$e = \overline{x} - I_{base} / 2 = 0 mm$

Eccentricity of reaction Loaded length of base Bearing pressure at toe Bearing pressure at heel Factor of safety

 $FoS_{bp} = P_{bearing} / max(q_{toe}, q_{heel}) = 4.429$ PASS - Allowable bearing pressure exceeds maximum applied bearing pressure

#### **RETAINING WALL DESIGN**

In accordance with EN1992-1-1:2004 incorporating Corrigendum dated January 2008 and the UK National Annex incorporating National Amendment No.1

 $I_{load} = I_{base} = 1550 \text{ mm}$ 

 $q_{toe} = F_{total\_v} \ / \ I_{base} = \textbf{33.9} \ kN/m^2$ 

 $q_{heel} = F_{total_v} / I_{base} = 33.9 \text{ kN/m}^2$ 

Tedds calculation version 2.6.04

#### Concrete details - Table 3.1 - Strength and deformation characteristics for concrete

Concrete strength class	C28/35
Characteristic compressive cylinder strength	f <sub>ck</sub> = <b>28</b> N/mm <sup>2</sup>
Characteristic compressive cube strength	f <sub>ck,cube</sub> = <b>35</b> N/mm <sup>2</sup>
Mean value of compressive cylinder strength	$f_{cm} = f_{ck} + 8 \text{ N/mm}^2 = 36 \text{ N/mm}^2$
Mean value of axial tensile strength	$f_{ctm}$ = 0.3 N/mm <sup>2</sup> × (f <sub>ck</sub> / 1 N/mm <sup>2</sup> ) <sup>2/3</sup> = <b>2.8</b> N/mm <sup>2</sup>
5% fractile of axial tensile strength	$f_{ctk,0.05} = 0.7 \times f_{ctm} = 1.9 \text{ N/mm}^2$
Secant modulus of elasticity of concrete	$E_{cm} = 22 \text{ kN/mm}^2 \times (f_{cm} / 10 \text{ N/mm}^2)^{0.3} = 32308 \text{ N/mm}^2$
Partial factor for concrete - Table 2.1N	γc = <b>1.50</b>
Compressive strength coefficient - cl.3.1.6(1)	$\alpha_{cc} = 0.85$
Design compressive concrete strength - exp.3.15	$f_{cd} = \alpha_{cc} \times f_{ck} \ / \ \gamma_C = \textbf{15.9} \ N/mm^2$
Maximum aggregate size	h <sub>agg</sub> = <b>20</b> mm

Reinforcement details Characteristic yield strength of reinforcement Modulus of elasticity of reinforcement Partial factor for reinforcing steel - Table 2.1N	$f_{yk} = 500 \text{ N/mm}^2$ $E_s = 200000 \text{ N/mm}^2$ $\gamma_S = 1.15$
Design yield strength of reinforcement	$f_{yd} = f_{yk} / \gamma_S = 435 \text{ N/mm}^2$
Cover to reinforcement	
Front face of stem	c <sub>sf</sub> = <b>40</b> mm
Rear face of stem	c <sub>sr</sub> = <b>50</b> mm
Top face of base	C <sub>bt</sub> = <b>50</b> mm
Bottom face of base	<sub>Cbb</sub> = <b>75</b> mm
Check stem design at 1893 mm	
Depth of section	h = <b>350</b> mm
Rectangular section in flexure - Section 6.1	
Design bending moment combination 1	M = <b>40.7</b> kNm/m
Depth to tension reinforcement	$d = h - c_{sf} - \phi_{sx} - \phi_{sfM} / 2 = 295 \text{ mm}$
	$K = M / (d^2 \times f_{ck}) = 0.017$
	K' = <b>0.207</b>
	K' > K - No compression reinforcement is required
Lever arm	$z = min(0.5 + 0.5 \times (1 - 3.53 \times K)^{0.5}, 0.95) \times d = 280 mm$
Depth of neutral axis	$x = 2.5 \times (d - z) = 37 \text{ mm}$
Area of tension reinforcement required	$A_{sfM.req} = M / (f_{yd} \times z) = 334 \text{ mm}^2/\text{m}$
Tension reinforcement provided	10 dia.bars @ 100 c/c
Area of tension reinforcement provided	$A_{sfM.prov} = \pi \times \phi_{sfM}^2 / (4 \times s_{sfM}) = 785 \text{ mm}^2/\text{m}$
Minimum area of reinforcement - exp.9.1N	$A_{sfM.min} = max(0.26 \times f_{ctm} / f_{yk}, 0.0013) \times d = 424 \text{ mm}^2/\text{m}$
Maximum area of reinforcement - cl.9.2.1.1(3)	$A_{sfM.max} = 0.04 \times h = 14000 \text{ mm}^2/\text{m}$
	max(A <sub>sfM.req</sub> , A <sub>sfM.min</sub> ) / A <sub>sfM.prov</sub> = <b>0.54</b>
PASS - Area of reinforcement provided is greater than area of reinforcement required	

#### **Deflection control - Section 7.4**

Reference reinforcement ratio	$\rho_0 = \sqrt{(f_{ck} / 1 \text{ N/mm}^2) / 1000} = 0.005$
Required tension reinforcement ratio	$\rho = A_{sfM.req} / d = 0.001$
Required compression reinforcement ratio	$\rho' = A_{sfM.2.req} / d_2 = 0.000$
Structural system factor - Table 7.4N	K <sub>b</sub> = 1
Reinforcement factor - exp.7.17	$K_s = min(500 \text{ N/mm}^2 / (f_{yk} \times A_{sfM.req} / A_{sfM.prov}), 1.5) = 1.5$
Limiting span to depth ratio - exp.7.16.a	$K_s  imes K_b  imes [11 + 1.5  imes \sqrt{(f_{ck} / 1 N/mm^2)}  imes  ho_0 /  ho + 3.2  imes \sqrt{(f_{ck} / 1 N/mm^2)}$
	N/mm <sup>2</sup> ) × (ρ <sub>0</sub> / ρ - 1) <sup>3/2</sup> ] = <b>251.4</b>

Noise and Nuisance Control	The contractor is to follow the good working practices and guidance laid down in the "Considerate Constructors Scheme". The hours of working will be limited to those allowed; 8am to 5pm Monday to Friday and Saturday Morning 8am to 1pm. None of the practices cause undue noise that one would typically expect from a construction site. The conveyor belt typically runs at around 70dB. The site has car parking to the front to which the skip will be stored. The site will be hoarded with 8' site hoarding to prevent access. The hours of working will further be defined within the Party Wall Act. The site is to be hoarded to minimise the level of direct noise from the site. Ground floor slab is not being removed minimising the vibration and sound to adjacent properties. While working in the basement the work generally requires hand tools to be used. The level of noise generally will be no greater than that of digging of soil. The noise is reduced and muffled by the working heing undertaken undertare under the level of and a cond muffled by the
	works being undertaken underground. A level of noise from a basement is lower than typical ground level construction due to this.
СТМР	The council may require a Construction Traffic Management plan to be produced. This is outside the brief of the Basement impact assessment and is not covered within Croft's Brief

## Appendix A ; Construction Method Statement

# **Basement Method Statement**

1B St Johns Wood Park: London W8

## 1B St Johns Wood Park

### 1. Basement Formation Suggested Method Statement.

- 1.1. This method statement provides an approach which will allow the basement design to be correctly considered during construction, and the temporary support to be provided during the works. The Contractor is responsible for the works on site and the final temporary works methodology and design on this site and any adjacent sites.
- 1.2. This method statement for 1B St Johns Wood Park has been written by a Chartered Engineer. The sequencing has been developed considering guidance from ASUC.
- 1.3. This method has been produced to allow for improved costings and for inclusion in the party wall Award. Should the contractor provide alternative methodology the changes shall be at their own costs, and an Addendum to the Party Wall Award will be required. 4.0
- 1.4. Contact party wall surveyors to inform them of any changes to this method statement.
- 1.5. The approach followed in this design is; to remove load from above and place loads onto supporting steelwork, then to cast retaining walls in underpin sections at the new basement level.
- 1.6. A soil investigation has been undertaken. The soil conditions are London Clay formation 5.0
- 1.7. The Chemical laboratory testing revealed below. Lead specialists are to be called in before work commences to remove the lead from the ground and treat the soil. Work should only commence once lead contamination has been eliminated.
  6.0

Chemical laboratory testing revealed an elevated level of lead in one sample of Made Ground. A level of 470mg/kg was noted within BH1/0.30m bgl in excess of the LQM/CIEH S4ULs of 210mg/kg for a *"Residential with homegrown produce"* scenario.

- 1.8. The bearing pressures have been limited to 150kN/m<sup>2</sup>. This is standard loadings for local ground conditions and acceptable to building control and their approvals.
- 1.9. The water table is expected to encountered at 0.5m BGL 7.0
- 1.10. Structural Water proofer (Not Croft) must comment on the design proposed and ensure they are satisfied that proposals will provide adequate water proofing.
   8.0
- 1.1. Provide engineers with concrete mix, supplier, deliver and placement methods 2 weeks prior to first pour. Site mixing of concrete should not be employed apart from in small sections <1m<sup>3</sup>. Contractor must provide method on how to achieve site mixing to correct specification, contractor must undertake tool box talks with staff to ensure site quality is maintained.

## 2. Enabling Works

- 2.1. The site is to be hoarded with ply sheet to 2.2m to prevent unauthorised public access.
- 2.2. Licenses for Skips and conveyors to be posted on hoarding
- 2.3. Provide protection to public where conveyor extends over footpath. Depending on the requirements of the local authority, construct a plywood bulkhead onto the pavement. Hoarding to have a plywood roof covering, night-lights and safety notices.
   9.0
- 2.4. Dewater: Water is expected at 0.5 depths
  - 10.0

2.4.1.Place a bore hole to the rear of the property down to a depth of 6m

2.4.2. Pump water away from site.

2.5. On commencement of construction the contractor should report any discrepancies to the structural engineer in order that the detailed design may be modified as necessary.

### 3. Piling Sequencing

- 3.1. Piles are to be installed at different levels and positions around the development. All piles are installed from the same level and cut down as required.
  - 11.0
    - 3.1.1.Prior to bringing the piling rig on site, check with the piling contractor the requirements of a working platform and install to their design and specification if required.
  - 3.1.2. Mark out datum line to determine various surface heights
  - 12.0
  - 3.1.3. Mark out pile sequence locations as specified by Engineer's drawings.

13.0

3.1.4. Following the sequencing guidance from the Engineers drawings mark out proposed pile position with a pair of reference markers at 1.0m from the pile pin, approximately 90 degrees apart.

14.0

3.1.5.Rig operator to set up over the pile pin position and position auger relative to reference marks. Directed and checked by banks man.

15.0

3.1.6.The flap at the tip of the auger is closed and secured. Auger tip lowered to ground level and position rechecked. Drilling to commence upon banks man approval.

16.0

3.1.7.Concrete is prepared while piling gang grout up concrete pump, hoses and flight, concrete pump operator to check concrete complies with design mix. Concrete held in agitator.

17.0

3.1.8.Rig operator augers to require design depth. Reference makers are to be used to check pile position during the first few meters of drilling.

18.0

3.1.9. If obstruction encountered, Engineer to be notified of pile number and depth. Move rig to next pile position whilst obstruction removal is dealt with. Contractor to be

advised on procedure should obstruction not be removable. If necessary, pile bores to be backfilled and made safe. Open excavation to be protected when open.

19.0

- 20.0
  - 3.1.10. When design depth reached, the auger is to be kept rotating to allow spoil in the bore to rise.
- 3.1.11. Concrete can be pumped to rig while rig operator monitors instrumentation and adjust auger rate of withdrawal accordingly.

21.0

3.1.12. Pressure, concrete flow and over-break to be monitored throughout operation.

22.0

3.1.13. During the withdrawal the rig operator is to activate the flight cleaner. If an automatic cleaner is not fitted to the rig then the piling gang must clean the flight manually to prevent spoil/ arising travelling above head height – this will be controlled by the piling foreman who must ensure the auger is not rotating when it is manually cleaned.

23.0

3.1.14. When auger tip reaches platform level, concrete pumping is stopped.

24.0

- 3.1.15. Attendant excavator as directed by the banks man clears spoil and concrete slurry from pile heap.
- 25.0
- 3.1.16. Banks man to check position of the cage in the pile, centrering where necessary. Reinforcement generally to be installed flush with Piling Platform Level (PPL). Anchor pile reinforcement or threaded bars that project above piling platform to have protective caps.

26.0

- 3.1.17. Concrete testing cube samples to be taken as per engineering specification. 27.0
- 3.1.18. Rig is moved onto next pile in the sequence and positioned as above, with piles installed as per points 3.1.5 3.1.12

28.0

3.1.19. Equipment to be cleaned and maintained as per normal methods.

29.0

3.1.20. This sequence of piling is to continue until all perimeter piles have been installed.

30.0

- 3.1.21. Cast internal bases and columns from basement to ground floor level. 31.0
- 3.2. Once all piles have been installed, bases and steel columns have been installed and additional temporary piles included, the next step sequence is to cast capping beams and install the steelwork at ground level that which in permanent condition will prop the external perimeter of the basement.
- 3.3. When steelwork has been set up, the excavation of the central mass can begin using mechanic excavators (an opening big enough to allow for access for machinery and spoil removal should be left.
   32.0
- 3.4. As excavation continues down, a dewatering system will need to be considered. There are several method of doing this but the most common method is to install well points from which ground water can be pumped as mentioned in point 2.4.1 33.0

3.5. Once excavation is level done to the intermediate floor level the steelwork is installed: this will prop the external perimeter of the basement in permanent condition as the ground floor steelwork. Effectively the basement is constructed in a top down method for other works to be the development to be undertaken at the same time as the basement dig out. 34.0

### 4. Demolition, Recycling, Dust/Noise Control and Site Hoarding

- 4.1. Demolition work is to take place within the hoarded confines of the materials such as stock bricks, timber etc. are to be recycled where possible. To minimise dust and dirt from demolition the following measures shall be implemented:
  - 4.1.1. Any debris or dust or dirt falling on the street and public highway will be cleared as it occurs by designated cleaners and washed down fully every night.
  - 4.1.2. Demolished materials are to be removed to a skip placed in front of the site which will be emptied regularly as required.
  - 4.1.3. All brickwork and concrete demolition work is to be constantly watered to reduce airborne dust
- 4.2. Building work which can be heard at the boundary of the site will not be carried out on Sundays or bank holidays and will be carried out within working hours as agreed by the council.

### 5. Trench sheet design and temporary prop Calculations

This calculation has been provided for the trench sheet and prop design of standard underpins in the temporary condition. There are gaps left between the sheeting and as such no water pressure will occur. Any water present will flow through the gaps between the sheeting and will be required to pump out.

Trench sheets should be placed at centres to deal with the ground. It is expected that the soil between the trench sheeting will arch. Looser soil will required tighter centres. It is typical for underpins to be placed at 1200c/c, in this condition the highest load on a trench sheet is when 2 nos trench sheets are used. It is for this design that these calculations have been provided.

Soil and ground conditions are variable. Typically one finds that in the temporary condition clays are more stable and the C<sub>u</sub> (cohesive) values in clay reduce the risk of collapse. It is this cohesive nature that allows clays to be cut into a vertical slope. For these calculations weak sand and gravels have been assumed The soil properties are:

Surcharge	sur = <b>10.</b> kN/m <sup>2</sup>	
Soil density	$\delta = 20 \text{ kN/m}^3$	
Angle of friction Soil depth	φ = <b>25</b> ° Dsoil = <b>3000.000</b> mm	
	$\begin{aligned} k_a &= (1 - \sin(\phi)) \ / \ (1 + \sin(\phi)) \\ k_p &= 1 \ / \ k_a \end{aligned}$	= 0.406 = 2.464
Soil Pressure bottom Surcharge pressure	soil = k <sub>a</sub> * $\delta$ * Dsoil surcharge = sur * k <sub>a</sub>	= <b>21.916</b> kN/m <sup>2</sup> = <b>4.059</b> kN/m <sup>2</sup>

### STANDARD LAP TRENCH SHEETING

# STANDARD LAP

The overlapping trench sheeting profile is designed primarily for construction work and also temporary deployment.
