

the little red cable

The TBTC cable is a critical part of the signalling system
We need your help in keeping it safe and in good operational order

Damage to the TBTC cable can have serious implications on our ability to run a full operational service

Ensure due care is taken when working in the track four-foot area. Do not rest rail directly on the cable use the appropriate rail storage tool

In the event of a re-railing, the TBTC loop cable must be re-laid in its original format

Any damage to the TBTC loop cable, however caused or detected must be reported to the site person in charge and the station supervisor immediately.

The fault report centre must also be informed immediately in order to initiate a repair as quickly as possible -
