| Executive Summary / Non-technical Summary |  |  |
|---|--|--|
|   | The London Borough of Camden requires a Basement Impact Assessment<br>(BIA) to be prepared for developments that include basements and<br>lightwells. This document forms the main part of the BIA and gives details on<br>the impact of surface water flow. The scheme design for the proposed<br>subterranean structure is also included.  |  |
|   | This document should be used in conjunction with the Hydrogeology and<br>Land Stability BIA (dated 2 December 2015). This is a separate assessment<br>and is referred to, where relevant, within this document.  |  |
|   | This BIA follows the requirements contained within Camden Council's planning guidance CGP4 – Basements and Lightwells (2015). In summary, the council will only allow basement construction to proceed if it does not:   |  |
|   | <ul> <li>cause harm to the built or natural environment and local amenity;</li> <li>result in flooding;</li> <li>lead to ground instability.</li> </ul>  |  |
|   | In order to comply with the above clauses, a BIA must undertake five stages detailed in CPG 4. This report has been produced in line with Camden planning guidance and associated supporting documents such as CPG1, DP23, DP26, DP25 and DP27. Technical information from 'Camden geological, hydrogeological and hydrological study - Guidance for subterranean development', Issue 01, November 2010 (GSD, hereafter) is also referred to in this assessment. |  |
| Project                                   | Description of Property  |  |
| Summary                                   | The site compirses an area of land adjacent to 1 St Johns Wood Park. The<br>land is occupied by a row of garages and a gated access road that leads<br>to St Johns Wood Park to the east and also to Middlesfield to the south-west.<br>The row of garages continues to the west along the access road.  |  |
|   | <b>Proposed Works</b><br>The proposed development consists of the following:   |  |
|   | <ul> <li>Demolition of existing garages</li> <li>Construction of a new detached house; this will comprise three stories above ground level and a single storey basement</li> </ul>   |  |
|   | Croft Structural Engineers Ltd has extensive knowledge of constructing new basements. Over the last 10 years Croft Structural Engineers has been   |  |

|  | involved in the design of over 500 basements in and around London. The outline method to be utilised at 1a St Johns Wood Park is:  |  |
|--|--|--|
|  | 1. Demolish the garages within the site boundary   |  |
|  | <ol> <li>Place a contiguous piled wall around the perimeter of the new basement</li> </ol>   |  |
|  | <ol> <li>Excavate the soil within the piled wall, propping the retained soil as<br/>necessary.</li> </ol>  |  |
|  | <ol> <li>Construct reinforced concrete inner walls around the building<br/>perimeter, within the contiguous piled wall.</li> </ol>   |  |
|  | 5. Continue with construction of basement structure.   |  |
|  | 6. Waterproof the internal space with a drained cavity system.   |  |
|  | 7. Proceed with the construction of the above ground structure   |  |
|  | Drainage, stability and potential ground movements are addressed in Section 4.   |  |
| Stage 1 –<br>Screening                       | Screening addressed areas of concern relating to Land Stability,<br>Hydrogeology, Surface Water and Flooding. This stage identified which of<br>these should be carried forward to scoping stage.  |  |
| Stage 2 –<br>Scoping                         | The Scoping stage identified potential impacts and set the parameters required for further study. This included areas that should be given special attention during the site investigation.  |  |
| Stage 3 – Site<br>investigation<br>and study | The property and the site were inspected and a walk over survey was<br>completed by an engineer. The information from this was used to formulate<br>the requirements for a ground investigation and also, where possible, to<br>corroborate data that would be gathered from a desk study. |  |
|  | Visual inspections were completed of the adjacent properties to determine if there were signs of structural movement.  |  |
|  | The immediate surrounding the sites have not been excavated. However, there are proposals to create basements in nearby plots of land.   |  |
|  | A ground investigation with 12.5m deep boreholes has been completed.   |  |

|                     | <ul> <li>The formation level of the basement will be in London Clay</li> <li>Initial standpipe readings did not encounter any water</li> </ul>   |  |  |
|---------------------|--|--|--|
|                     | Laboratory testing was undertaken on the soil samples.   |  |  |
|                     | Ground water was measured. The readings are as follows:  |  |  |
|                     | A repeat reading observed water at 0.5m below ground level   |  |  |
| Stage 4 –<br>Impact | Land stability   |  |  |
| assessment          | An assessment of land stability was made in view of the proposals for the excavation and construction of the basement. Ground heave was predicted and it was concluded that this can be accommodated with the use of void formers below the basement. From an evaluation of the ground conditions, it is concluded that a basement can be safely constructed at the site.  |  |  |
|                     | Hydrogeology   |  |  |
|                     | It is understood that a perched water table is present below the ground<br>surface and that this can be suitably managed during construction. The<br>perched water is present within a layer of permeable soil that rests on<br>London Clay. Under permanent conditions, water can continue to migrate<br>through this layer, around the basement. From an evaluation of the ground<br>conditions, it is concluded that a basement can be safely constructed at<br>the site. |  |  |
|                     | Drainage & Surface Water Flow  |  |  |
|                     | No surface water features are noted within a 250m radius of the site.<br>Examination of Environment Agency data shows that the site is not situated<br>in a zone which is at risk of surface water flooding from rivers or seas. There<br>will not be an increase in hard-surfaced areas. There will be no significant<br>impacts on the risk of flooding or the surface water flow within or around the<br>site.  |  |  |

٦

| 1. Screening Stage |   |  |
|--------------------|---|--|
|                    | Camden Council stipulates that any subterranean development proposal<br>should be screened to determine whether a full BIA is required.   |  |
|                    | areas of concern that will require further investigation.   |  |
|                    | Description of Property   |  |
|                    | The site compirses an area of land adjacent to 1 St Johns Wood Park.  |  |
|                    | Fgure 1: Aerial view with approx. site area indicated   |  |
|                    | The land is occupied by a row of garages and a gated access road that<br>leads to St Johns Wood Park to the east and Middlesfield to the south-west.<br>The row of garages continues to the west along the access road.       |  |
|                    | Proposed Development  |  |
|                    | The proposed development involves the demolition of existing garages and<br>subsequent construction of a new detached house. The new building will<br>comprise three stories above ground level and a single storey basement. |  |
|                    | The planning application drawings for this development have been produced by Shaun Knight Architecture and are submitted separately from this assessment.   |  |
|                    | The outline method to be utilised at 1a St Johns Wood Park is:  |  |

|                      | 1. Demolish the garages within the site boundary   |  |  |
|----------------------|--|--|--|
|                      | <ol> <li>Place a contiguous pile wall around the perimeter of the new basement</li> </ol>  |  |  |
|                      | <ol> <li>Excavate soil within the piled perimeter, propping the retained soil<br/>as necessary.</li> </ol>                         |  |  |
|                      | <ol> <li>Construct reinforced concrete inner walls around the building<br/>perimeter, within the contiguous piled wall.</li> </ol> |  |  |
|                      | 5. Continue with the construction of the basement structure.   |  |  |
|                      | 6. Waterproof the internal space with a drained cavity system.   |  |  |
|                      | 7. Proceed with the construction of the above ground structure   |  |  |
|                      | A detailed method statement is proposed and appended.  |  |  |
|                      | The questions below are taken from <i>Camden CPG 4 – Basements and Lightwells</i> .  |  |  |
| Land Stability       | Refer to the combined assessment on Hydrogeology and Land Stability<br>(dated 2 December 2015)                                     |  |  |
| Subterranean<br>Flow | Refer to the combined assessment on Hydrogeology and Land Stability<br>(dated 2 December 2015)                                     |  |  |

| areas so the inflows wi  | l remain uncha   | inged.   |
|--|--|--|
| Question 5. Will the pro<br>surface water being re<br>watercourses?  | posed baseme<br>ceived by adja   | ent result in changes to the quality<br>acent properties or downstream   |
| <b>No</b> . Collected surface<br>before. The quality of<br>change.   | water will be fi<br>the water rece   | rom building roofs and paving, as<br>ived downstream will therefore no   |
| Question 6 : Is the site<br>according to either the<br>Strategic Flood Risk As<br>because the proposed<br>surface water feature?<br>The potential sources of | n an area iden<br>Local Flood Ri<br>sessment or is i<br>I basement is b<br>of flooding are | itified to have surface water flood<br>isk Management Strategy or the<br>t at risk from flooding, for example<br>below the static water level of nea<br>summarised below:  |
| Potential Source   | Potential<br>Flood Risk<br>at site?  | Justification  |
| Fluvial flooding   | No   | EA Flood Mapping Shows Flood<br>Zone 1. Distance from nearest<br>surface watercourse >1km  |
| Tidal flooding   | No   | Site location is 'inland' and topography > 50mAOD.   |
|  | No   | Site is located on low   |
| Flooding from rising /<br>high groundwater   | 110  | permeability condon Clay.  |
| Flooding from rising /<br>high groundwater<br>Surface water<br>(pluvial) flooding  | No   | The development is not on the<br>list of streets that were flooded<br>in 1975 and/or 2002  |
| Flooding from rising /<br>high groundwater<br>Surface water<br>(pluvial) flooding<br>Flooding from<br>infrastructure failure                                 | No<br>Yes  | Define a bility London Clay.The development is not on the<br>list of streets that were flooded<br>in 1975 and/or 2002Drainage at or near the site<br>could potentially become<br>blocked or cracked and<br>overflow or leak. Drainage of<br>the basement areas may rely<br>on pumping. |

| surface water flow and flooding are not significant. These questions           |
|--|
| therefore do not have to be carried forward to Scoping Stage.                  |
|  |
| In answering Question 6, a flood risk assessment is not considered             |
| necessary: the property is not on a street that has flooded in 1975 or 2002    |
| and there are no risks to flooding that are greater than those inherent with   |
| all subterranean structures. However, the risks associated with infrastructure |
| failure should be investigated further. The assessment, with regards to        |
| Surface Water Flow, should be carried forward to Scoping Stage.                |
|  |

Г

| 2. Scoping Stage           |   |  |
|----------------------------|---|--|
|                            | This stage identifies the potential impacts of the areas of concern that were highlighted in the Screening phase.   |  |
| Land Stability             | Refer to the combined assessment on Hydrogeology and Land Stability<br>(dated 2 December 2015)  |  |
| Subterranean<br>Flow       | Refer to the combined assessment on Hydrogeology and Land Stability<br>(dated 2 December 2015)  |  |
| Surface Flow<br>& Flooding | The existing site has of garages that will be demolished to give way for new basement and a three storey above-ground structure.  |  |
|                            | The basement will be below an area that is currently hard-surfaced. The development will therefore not affect the above ground flow.  |  |
|                            | It is evident from the screening study that the only significant flood risks at<br>1a St Johns Wood Park are due to the failure of existing sewers in the vicinity<br>of the site. The flow paths of surface water around the property should be<br>investigated further. |  |
|                            | Carry forward to Site Investigation & Desk Study  |  |

| 3. Site Investigation and Study |   |  |
|---------------------------------|---|--|
|                                 | This section identifies the relevant features of the site and its immediate surroundings, providing further scoping where required.   |  |
|                                 | Desk Study and Walkover Survey  |  |
|                                 | The site compirses an area of land adjacent to 1 St Johns Wood Park. The<br>land is occupied by a row of garages and a gated access road that links St<br>Johns Wood Park (to the east) to Middlesfield (to the south-west). The row of<br>garages continues to the west along the access road. |  |
|                                 |   |  |
|                                 | Figure 3: View of existing site looking from west to east<br>The site is covered with hard surfacing. There are trees, shrubs and soft  |  |
|                                 | walls constructed from brickwork separate these from the site.  |  |
|                                 | The site is not in a conservation area.   |  |
|                                 | Noma Manzini, a Structural Engineer from Croft Structural Engineers visited<br>1a St Johns Wood Park on 16 <sup>th</sup> June 2015  |  |
| Proposed<br>Development         | The garages within the site boundary will be demolished to give way for a new residential property. The new building will be three storeys high above ground level and will also include a basement. For further details of the   |  |

|               | architectural design, refer to drawings by Shaun Knight Architecture.   |  |
|---------------|---|--|
| Site History  | As referred to in the combined assessment on Hydrogeology and Land<br>Stability, historical maps show that the site and the surrounding area have<br>been residential for over 125 years. |  |
| Local Bombing | A highly explosive bomb is recorded in the Aggregate Night Time bomb census as having been dropped nearby, between 7 <sup>th</sup> October and 6 <sup>th</sup> June 1941.                 |  |
|               | rigure 4: Extract norm bomb Survey Map  |  |

| Geology                                      | Refer to the Ground Investigation report and the Hydrogeological and Land Stability assessment.  |  |
|--|--|--|
| Highways                                     | The site is not within 5m of the public highway.   |  |
| London<br>Underground<br>and Network<br>Rail | The site is more than 20m away from the nearest national rail line. The proposed basement is unlikely to significantly affect this. The London Underground Jubilee Line runs close by.<br>$\begin{array}{c} \hline \\ \hline $   |  |
| UK Power<br>Networks                         | There are no significant items of electrical infrastructure (such as pylons or substations) in the immediate vicinity.   |  |
| Vicinity of<br>Trees                         | There are trees close by, in the neighbouring land. These do not have tree preservation orders. The closest tree is more than 4m away from the outline of the proposed basement.<br>BS 5837: 2005 <i>Trees in relation to construction</i> estimates the root protection area (RPA) equivalent to a circle with a radius12 times the stem diameter. Based on the diameter of the tree as being 400mm, the diameter of this circle would be 4.8m. The roots concerned would therefore be within 2.4m from the trunk. These would not be affected by a basement that is 4m away. |  |

|   | Adjacent Properties  |  |  |
|---|--|--|--|
|   | The external facades of the neighbouring properties have been inspected.   |  |  |
|   | Image: contrast of the sum o |  |  |
|   | Descriptions of the properties below are given in an anti-clockwise order starting from the neighbouring land to the north.  |  |  |
| Garages off<br>Boydell Court<br>(properties to<br>the North)                                | The land immediately to the north of the site is occupied by garages and an access road. Part of the area to the north is covered with soft landscaping. None of the structures immediately to the north appear to be occupied for continual habitable use. Searches of the Planning applications on Camden Council's website show that no basements are present below any of these structures.  |  |  |
| Nos 4 to 7<br>Court Close<br>and No 5<br>Boydell Court<br>(properties to<br>the North-west) | Nos 2 to 7 Court Close and No 5 Boydell Court are terraced houses and a<br>high rise apartment block respectively. Given the height of the apartment<br>block, piled foundations are assumed, which are likely to be deeper than<br>the formation of the proposed basement. These properties are not<br>immediately adjacent to the site boundary. No structural defects were<br>noted externally by visual inspection   |  |  |
|   | Searches from the Planning applications on Camden Council's website show that no basements are present below these buidlings.  |  |  |

|  | Fgure 4: Existing properties to the rear and north-west (behind the garages in the foreground)  |  |
|--|---|--|
| Land off<br>Middlefield<br>(property to<br>the west)             | This area is currently occupied by garages. This land is registered to be<br>developed with the inclusion of basements below new residential buildings.<br>At detailed design and also at construction stage, co-ordination should be<br>maintained with the developers of this property to ensure that any<br>combined impacts on the neighbouring properties are adequately |  |

| the east                              | highway, there are gullies, indicative of a surface water trunk sewer below.   |  |  |
|                                       | As described previously, there is an underground tube line below the road  |  |  |
|                                       |  |  |  |
|                                       | Monitoring, Reporting and Investigation  |  |  |
|                                       |  |  |  |
|                                       | The ground investigation report, which has data from initial site investigations   |  |  |
|                                       | and data from subsequent monitoring, is available as a separate report.  |  |  |
|                                       |  |  |  |

| Ground Inv             | d Investigation   |  |  |
|------------------------|---|--|--|
| Ground                 | The ground investigation was completed by Ground & Water Ltd.   |  |  |
| Investigation<br>Brief | From the Scoping stage Croft considered that the brief should cover:  |  |  |
|                        | • Two trial pits to confirm the existing foundations of existing garages.<br>The purpose is to consider the effect of the works on the<br>neighbouring properties and the find the ground conditions below<br>the site. |  |  |
|                        | <ul> <li>One borehole to a depth of 12.5m below ground level (i.e. more<br/>than twice the depth of the proposed basement).</li> </ul>  |  |  |
|                        | <ul> <li>Stand pipe to be inserted to monitor ground water; record initial<br/>strike and the water level after 1 month.</li> </ul>   |  |  |
|                        | <ul> <li>Site testing to determine insitu soil parameters. SPT testing to be<br/>undertaken.</li> </ul>   |  |  |
|                        | <ul> <li>Laboratory testing to confirm soil make up and properties.</li> </ul>  |  |  |
|                        | <ul> <li>The Historic maps and walk over survey did not highlight any<br/>significant contamination sources, therefore no site test of the<br/>ground has been requested.</li> </ul>                                    |  |  |
|                        | Factual report on soil conditions.  |  |  |
|                        | Interpretative reports  |  |  |
|                        | Calculation of bearing pressures from SPT.  |  |  |
|                        | • Indication of $\emptyset$ (angle of friction) from SPT.   |  |  |
|                        | Indication of soil type   |  |  |
|                        | Refer to the ground investigation report by Ground & Water Ltd, which is<br>submitted as a separate document. Data relevant to land stability and<br>subterranean flow is examined separate documents.                  |  |  |

| Land Stability       | Refer to the combined assessment on Hydrogeology and Land Stability (dated 2 December 2015) for land stability issues addressed to Stage 3.  |
|----------------------|--|
| Subterranean<br>Flow | Refer to the combined assessment on Hydrogeology and Land Stability (dated 2 December 2015) for hydrogeological issues addressed to Stage 3. |

| Surface Flow & |  |
|----------------|--|
| Flooding       | A walk over survey has confirmed that there are no surface water features,         |
|                | either within or close to the site. The survey has also confirmed that the site is |
|                | covered with hard surfaces. Rainwater from these surfaces is likely to flow in     |
|                | the direction of the slope of the surrounding area, ie from north-west to south    |
|                | east. This will be towards St Johns Wood Park, which is drained by gullies.        |
|                |  |

| 4. Basement Impact Assessment         |  |  |
|---------------------------------------|--|--|
| Subterranean<br>Flow                  | Refer to the combined assessment on Hydrogeology and Land Stability<br>(dated 2 December 2015)   |  |
| Land Stability                        | Refer to the combined assessment on Hydrogeology and Land Stability<br>(dated 2 December 2015)   |  |
| Surface water<br>flow and<br>flooding | As described in previous sections, there are no significant risks of flooding.<br>However, there are risks which are inherit in the construction of all<br>subterranean structures, such as flooding due to unexpected failure of the<br>drainage, water mains, etc. For this reason, Croft would recommend the<br>following measures to reduce these risks: |  |
|                                       | <ul> <li>To reduce the likelihood of flooding into the lightwells, these should<br/>be designed (at detailed design stage) with upstands above<br/>ground level.</li> </ul>  |  |
|                                       | <ul> <li>A pumping mechanism with a non-return valve should be installed<br/>for the proposed basement. There is a likelihood that this may fail<br/>and allow excess water to accumulate. If this were to occur, the<br/>build-up of water would be gradual and noticeable before it<br/>becomes a significant life-threatening hazard.</li> </ul>          |  |
|                                       | <ul> <li>Install a dual pumping system to maintain operation in the event of<br/>a failure. This should include a battery backup and a suitable<br/>alarm system for warning purposes.</li> </ul>  |  |
|                                       | The risk of flooding from excess surface water is not considered significant.<br>There is a risk of flooding due to the failure of the pumping system but this<br>can be reduced to acceptable levels with appropriate design and<br>installation measures.  |  |
|                                       | Given that the amount of hardstanding will remain unchanged, the<br>installation of facilities for SUDS would not be necessary: the current<br>drainage infrastructure can, and will be able to cope, with surface water<br>discharged from this site.   |  |

## Mitigation Measures

A method statement, appended, has been formulated with Croft's experience of over 500 basements completed without error. As mentioned previously, the procedures described in this statement will mitigate the impacts that the construction of the basement will have on nearby properties.

The works must be carried out in accordance with the Party Wall Act and condition surveys will be necessary at the beginning and the end of the works. The Party Wall Approval procedure will reinforce the use of the proposed method statement and, if necessary, require it to be developed in more detail with more stringent requirements than those required at planning stage.

It is not expected that any cracking will occur in nearby structures during the works. However, Croft's experience advises that there is a risk of movement to the neighbouring properties (garages).

To reduce the risk to the development:

- Employ a reputable firm that has extensive knowledge of basement works.
- Employ suitably qualified consultants; Croft Structural Engineers has completed over 500 basements in the last five years.
- Provide method statements for the contractors to follow
- Investigate the ground; this has now been done.
- Record and monitor the properties close by. This is completed by a condition survey under the Party Wall Act, before and after the works are completed. Refer to the end of the appended Basement Construction Method Statement.

With the measures listed above, the maximum level of cracking anticipated is 'Hairline' cracking. This can be repaired with normal decorative works. Under the Party Wall Act, minor damage, although unwanted, can be tolerated; it is permitted to occur to a neighbouring property as long as repairs are suitability undertaken to rectify this. To mitigate this risk, the Party Wall Act is to be followed and a Party Wall Surveyor will be appointed.

| Monitoring               |  |  |  |
|--------------------------|--|--|--|
|                          | <b>Monitoring</b> - In order to safeguard the existing structures during the new basement construction, movement monitoring is to be undertaken.   |  |  |
| Monitoring<br>Conclusion | The degree of monitoring is proportionate to the size of the development<br>and the types of building affected. Various levels are described within the<br>proposed monitoring statement (appended).<br>The level of Monitoring Croft recommend on this development is:  |  |  |
|                          | Monitoring 5<br>Visual inspection and production of<br>condition survey by Party wall surveyors<br>at the beginning of the works and also at<br>the end of the works.<br>Visual inspection of neighbour's wall<br>during the works.<br>Vertical & lateral monitoring movement<br>by theodolite at specific times during the<br>projects.   | Underpinning works to Grade I<br>listed buildings<br>Basements to Listed building<br>Basements deeper than 4m in<br>gravels<br><u>Basements deeper than 4.5m</u><br><u>in clays</u><br>Underpinning, basements to<br>buildings that are expressing<br>defects. |  |
|                          | <ul> <li>Before the works begin a detailed monitoring report is required to confirm the implementation of the monitoring. The items that this should cover are:</li> <li>Risk Assessment to determine level of monitoring</li> <li>Scope of Works</li> <li>Applicable standards</li> <li>Specification for Instrumentation</li> <li>Monitoring of Existing cracks</li> <li>Monitoring of movement</li> <li>Reporting</li> <li>Trigger Levels using a RED AMBER GREEN System</li> </ul> |  |  |

| Basement Des<br>Consideration                            | sign & Construction Impacts and Initial Design   |  |  |  |  |  |  |  |
|--|--|--|--|--|--|--|--|--|
| Structural<br>Scheme                                     | A reinforced concrete slab and a contiguous piled wall will form the new foundation of the property. The piled wall, to be designed at detailed design stage, will resist the lateral pressures on the side of the basement.<br>The investigations highlight that water is present. The walls are designed to cope with the hydrostatic pressure. It is possible that a water main may break causing a local high water table. To account for this, the wall is designed for water at full height.<br>The detailed design should consider floatation as a risk. However, by inspection, the weight of the building is likely to be greater than the uplift forces from the water, resulting in a stable structure.<br>The site is within 5m of a road surface; the basement wall is further away. However, to account for the possibility of emergency services vehicles occupying the pavement, highways loading should be allowed for.<br>Drawings are appended. The details given on these should not be used for construction: detailed design will follow after the planning application process. |  |  |  |  |  |  |  |

| Retained soil     | Design overall stability to $K_a \propto K_p$ values. Lateral movement necessary to |  |  |  |  |  |  |  |
| Parameters        | deflection limits of the concrete wall  |  |  |  |  |  |  |  |
|                   | Has a soil investigation been carried out? Ves                                      |  |  |  |  |  |  |  |
| Water Table       | has a sommestigation been canned out.   |  |  |  |  |  |  |  |
|                   | Design permanent condition for water table level:                                   |  |  |  |  |  |  |  |
|                   | If deeper than existing, design reinforcement for water table at full               |  |  |  |  |  |  |  |
|                   | basement depth to allow for local failure of water mains, drainage and              |  |  |  |  |  |  |  |
|                   | storm water. Global uplift forces can be ignored when the groundwater               |  |  |  |  |  |  |  |
|                   | table is lower than the basement. BS8102 only indicates guidance.                   |  |  |  |  |  |  |  |
|                   |   |  |  |  |  |  |  |  |
| Drainage and      | Drainage and damp-proofing is by others: details are not provided within            |  |  |  |  |  |  |  |
| Waterproofing     | Croft SE's brief.   |  |  |  |  |  |  |  |
| prosing           |   |  |  |  |  |  |  |  |

|                         | the water proofing requirements are met. Croft SE is neither the waterproofing designer nor acting as the structural waterproofing designer.<br>The waterproofing specialist must name their structural waterproofer. The structural waterproofer must inspect the structural details and confirm that he is happy with the robustness.<br>Due to the segmental construction nature of the basement, it is not possible to water proof the joints. All water proofing must be made by the waterproofing specialist. He should review Croft's details and advise if water bars and stops are necessary.  |  |  |  |  |  |  |  |
|-------------------------|---|--|--|--|--|--|--|--|
|                         | The waterproofing designer must not assume that the structure is watertight.<br>To help reduce water flow through the joints, the following measures should<br>be applied:  |  |  |  |  |  |  |  |
|                         | <ul> <li>All faces should be cleaned of all debris and detritus</li> <li>Faces between concrete segments should be needle hammered to improve key for bonding</li> <li>All pipe work and other penetrations should have puddle flanges</li> <li>or hydrophilic strips</li> </ul>  |  |  |  |  |  |  |  |
| Localised<br>Dewatering | <ul> <li>Localised dewater to pins may be necessary.</li> <li>Some engineers may raise the theoretical questions about pumping of water causing localised settlement. We believe that this argument is a red herring when applied to single storey basements and our reason for stating this is: <ul> <li>The water table in the area is variable,</li> <li>The water level naturally rises and falls over time and does not lead to subsidence</li> <li>The water table has naturally been rising and falling for over the last 20,000 years, any fines that will have been removed from the soil would have done so already.</li> <li>If the water table rises and falls naturally why does this not cause subsidence due to fine removals every year? It does not because the soil has been soil is naturally consolidated by the rise and fall of the water table in the area.</li> <li>The effect of local pumping for small excavations will not affect the local area.</li> <li>There is only a risk of subsidence from large scale pumping of soil which lowers the water table below is natural lowest level.</li> </ul> </li> </ul> |  |  |  |  |  |  |  |
| Temporary<br>Works      | Temporary propping details will be required and this must be provided by<br>the contractor. Their details should be forwarded to Croft Structural<br>Engineers.   |  |  |  |  |  |  |  |

| CTMP | The council may require a Construction Traffic Management plan to be<br>produced. This is outside the brief of the Basement Impact Assessment and is<br>not covered within Croft's brief |

# Appendix A : Calculations

These calculations are for the scheme design only and should not be used at detailed design or construction stage.

# **Design Concept**

Contiguous piles around the perimeter of the building will resist lateral loading from the retained soil. This should include full height hydrostatic pressures. The piled wall will be propped at the head by temporary props in the temporary condition (as indicated in drawing SL-50, appended) and by the ground floor structure in the permanent case (refer to drawings SL-10 and SL-30, appended). The ground floor structure will transfer theses horizontal loads to the opposite wall.

At detailed design stage, the contiguous piled wall should resist highways surcharge loads (10kN/m<sup>2</sup>).

PASS - Area of reinforcement provided is greater than area of reinforcement required

#### WALL 2 (CONDITION 3)

Water is on both sides of the wall therefer the wall is more stable

## Appendix B : Ground Movement Assessment Calculations

These calculations are for the scheme design only and should not be used at detailed design or construction stage.

Separate assessments are done for the main part of the basement and for the swimming pool.

Relative vertical movement as defined by Figure 2.18 (a) in CIRIA C580  $\Delta = -10.4 \text{ mm} \qquad \Delta/L = -0.080\%$ 

at max sagging location

#### Total movement at wall location (excavation and installation)

Total Horizontal Movement (excavation and installation)  $\delta_h = -11.4 \text{ mm}$ 

Total Vertical Movement (excavation and installation) ∆ = -12.8 mm Note: max relative vertical movements will not occur at the same dstance for excavation and installation. However, these have been added and therefore the total vertical movement is conservative

#### TOTAL STRAIN (EXCAVATION AND INSTALLATION)

Table 2.5 CIRIA C580

| Category of Damage | Normal Degree          | Limiting Tensil | e Strair | n %    |
|--------------------|------------------------|-----------------|----------|--------|
| 0                  | Negligible             | 0.00%           | -        | 0.05%  |
| 1                  | Very slight            | 0.05%           | -        | 0.075% |
| 2                  | Slight                 | 0.075%          | -        | 0.15%  |
| 3                  | Moderate               | 0.15%           | -        | 0.30%  |
| 4 to 5             | Severe to Very Servere | e >             |          | 0.30%  |

Anticipated Damage may be categorised as 'Negligible' to ' Slight' ; Category 0-2  $\epsilon_{lim} = 0.150\%$ 

## Appendix C : Construction Method Statement

# **Basement Method Statement**

Site Details:

1B St Johns Wood Park London W8

Client Information:

Mike Ofori Liv. International 1 Regency Parade NW3 5EQ

### 1. Basement Formation Suggested Method Statement.

- 1.1. This method statement provides an approach which will allow the basement design to be correctly considered during construction, and the temporary support to be provided during the works. <u>The Contractor is responsible for the works on site and the final temporary works methodology and design on this site and any adjacent sites.</u>
- 1.2. This method statement for the development of 1a St Johns Wood Park. It has been written by a Chartered Engineer. The overall sequence is shown on drawing SL-50.
- 1.3. This proposed method has been developed to allow for improved costings and for inclusion in the Party Wall Award. Should the contractor provide alternative methodology the changes shall be at their own costs, and an Addendum to the Party Wall Award will be required.
- 1.4. Contact party wall surveyors to inform them of any changes to this method statement.
- 1.5. Contact the developers of any adjacent or nearby sites to inform them of the proposed works.
- 1.6. The approach followed in this design is:
  - i. demolish the existing structures (garages)
  - ii. install a contiguous piled wall with capping beam around the perimeter
  - iii. excavate within the contiguous piled walls;
    - provide adequate propping, with propping to the head and include mass concrete thrust blocks for prop support at base
  - iv. construct the new building from basement level upwards.
- 1.7. A soil investigation has been undertaken. The soil conditions are London Clay formation
- 1.8. The Chemical laboratory testing is revealed below. Lead specialists are to be called in before work commences to remove the lead from the ground and treat the soil. Work should only commence once lead contamination has been eliminated.

Chemical laboratory testing revealed an elevated level of lead in one sample of Made Ground. A level of 470mg/kg was noted within BH1/0.30m bgl in excess of the LQM/CIEH S4ULs of 210mg/kg for a *"Residential with homegrown produce"* scenario.

- 1.9. The water is expected to be encountered at approximately 0.5m below ground level (BGL). Following piling around the perimeter, and during the subsequent excavations, dewater locally (create sumps from which water can be pumped out of).
- 1.10. The structural water proofer (not Croft) must comment on the proposed design and ensure that this will provide adequate water proofing.
- 1.1. Provide engineers with concrete mix, supplier, deliver and placement methods 2 weeks prior to first pour. Site mixing of concrete should not be employed apart from in small sections <1m<sup>3</sup>. Contractor must provide method on how to achieve site mixing to the correct specification; the contractor must undertake tool box talks with staff to ensure site quality is maintained.

### 2. Enabling Works

- 2.1. The site is to be hoarded with ply sheet to 2.2m to prevent unauthorised public access.
- 2.2. Demolish the occupying garages. Refer to Section 4 for demolition proposals.
- 2.3. Licences for skips and conveyors to be posted on hoarding
- 2.4. On commencement of construction, the contractor should report any discrepancies to the structural engineer in order that the detailed design may be modified as necessary.

#### 3. Piling Sequencing

For general piling procedures, refer to the piling contractor's method statement. The anticipated sequence is as follows:

- 3.1. Piles are to be installed at different levels and positions around the development. All piles are installed from the same level and cut down as required.
  - 3.1.1.Prior to bringing the piling rig on site, check with the piling contractor the requirements of a working platform and install to their design and specification if required.
  - 3.1.2. Mark out datum line to determine various surface heights
  - 3.1.3. Mark out pile sequence locations as specified by Engineer's detailed design stage drawings.
  - 3.1.4. Following the sequencing guidance from the Engineers detailed design stage drawings, mark out proposed pile position with a pair of reference markers at 1.0m from the pile pin, each forming a line to the pile, mutually rotated at 90 degrees.
  - 3.1.5.Rig operator to set up over the pile pin position and position auger relative to reference marks. Directed and checked by banks man.
  - 3.1.6.The flap at the tip of the auger is closed and secured. Auger tip lowered to ground level and position rechecked. Drilling to commence upon banks man approval.
  - 3.1.7.Concrete is prepared while piling operatives grout up concrete pump, hoses and flight, concrete pump operator to check concrete complies with design mix. Concrete held in agitator.
  - 3.1.8.Rig operator augers to require design depth. Reference makers are to be used to check pile position during the first few metres of drilling.
  - 3.1.9. If obstruction encountered, Engineer to be notified of pile number and depth. Move rig to next pile position whilst obstruction removal is dealt with. Contractor to be advised on procedure should obstruction not be removable. If necessary, pile bores to be backfilled and made safe. Open excavation to be protected when open.

- 3.1.10. When design depth reached, the auger is to be kept rotating to allow spoil in the bore to rise.
- 3.1.11. Concrete can be pumped to rig while rig operator monitors instrumentation and adjust auger rate of withdrawal accordingly.
- 3.1.12. Pressure, concrete flow and over-break to be monitored throughout operation.
- 3.1.13. During the withdrawal the rig operator is to activate the flight cleaner. If an automatic cleaner is not fitted to the rig then the piling gang must clean the flight manually to prevent spoil/ arising travelling above head height this will be controlled by the piling foreman who must ensure the auger is not rotating when it is manually cleaned.
- 3.1.14. When auger tip reaches platform level, concrete pumping is stopped.
- 3.1.15. Attendant excavator as directed by the banks man clears spoil and concrete slurry from pile heap.
- 3.1.16. Banks man to check position of the cage in the pile, centring where necessary. Reinforcement generally to be installed flush with Piling Platform Level (PPL). Anchor pile reinforcement or threaded bars that project above piling platform to have protective caps.
- 3.1.17. Concrete testing cube samples to be taken as per engineering specification.
- 3.1.18. Rig is moved onto next pile in the sequence and positioned as above, with piles installed as per points 3.1.5 3.1.12
- 3.1.19. Equipment to be cleaned and maintained as per normal methods.
- 3.1.20. This sequence of piling is to continue until all perimeter piles have been installed. As piling progresses wound perimeter, construct reinforced concrete capping beam to piles.
- 3.1.21. Excavate within the contiguous piled wall perimeter, construct mass concrete thrust blocks and install props as excavations progress.
  - 3.1.21.1. <u>The piled wall should be propped until the permanent structure is complete</u> (refer to item 3.2). Propping should include props to the head, ie to the capping beam. The contractor should provide proposals for propping to the structural engineer who is responsible for the detailed design of the permanent structure at least two weeks before the excavations commence.
- 3.2. Once all piles have been installed, and bases for steel columns have been installed, the next step sequence is to install the steelwork at ground level. In the permanent condition, this will prop the external perimeter of the basement.
- 3.3. When steelwork has been set up, the excavation of the central mass can begin using mechanic excavators (an opening big enough to allow for access for machinery and spoil removal should be left).
- 3.4. As excavation continues down, a dewatering system will need to be considered. There are several methods of doing this but the most common method is to create sumps from which ground water can be pumped as mentioned in 1.9.

### 4. Demolition, Recycling, Dust/Noise Control and Site Hoarding

- 4.1. Demolition work is to take place within the hoarded confines of the materials such as stock bricks, timber etc. are to be recycled where possible. To minimise dust and dirt from demolition the following measures shall be implemented:
  - 4.1.1. Any debris or dust or dirt falling on the street and public highway will be cleared as it occurs by designated cleaners and washed down fully every night.
  - 4.1.2. Demolished materials are to be removed to a skip placed in front of the site which will be emptied regularly as required.
  - 4.1.3. All brickwork and concrete demolition work is to be constantly watered to reduce airborne dust
- 4.2. Building work which can be heard at the boundary of the site will not be carried out on Sundays or bank holidays and will be carried out within working hours as agreed by the council.

### 1. Introduction

Basement works are intended at 1a St Johns Wood Park. The structural works for this require Party Wall Awards. This statement describes the procedures for the Principal Contractor to follow to observe any movement that may occur to the existing properties, and also describes mitigation measures to apply if necessary.

### 2. Risk Assessment

The purpose of this risk assessment is to consider the impact of the proposed works and how they impact the party wall. There are varying levels of inspection that can be undertaken and not all works, soil conditions and properties require the same level of protection.

| Monitoring Level Proposed  | Type of Works.  |
|--|---|
| Monitoring 1<br>Visual inspection and production of condition survey by<br>Party wall surveyors at the beginning of the works and<br>also at the end of the works. | Loft conversions, cross wall removals,<br>insertion of padstones<br>Survey of LUL and Network Rail tunnels.<br>Mass concrete, reinforced and piled<br>foundations to new build properties |

| Monitoring 2<br>Visual inspection and production of condition survey by<br>Party Wall Surveyors at the beginning of the works and<br>also at the end of the works.<br>Visual inspection of existing party wall during the works.<br>Inspection of the footing to ensure that the footings are<br>stable and adequate.  | Removal of lateral stability and insertion<br>of new stability fames<br>Removal of main masonry load bearing<br>walls.<br>Underpinning works less than 1.2m<br>deep  |

### 3. Scheme Details

This document has been prepared by Croft Structural Engineers Ltd. It covers the proposed construction of a new basement for 1A St Johns Wood Park. Most of the basement will require excavations no greater than 3.5m deep. To the rear of the property, a portion of the basement will require excavations greater than 4.5m (down to 6m below ground level). Therefore monitoring level 5 is proposed for this development.

### Scope of Works

The works comprise:

- Visual Monitoring of the party wall
- Attachment of Tell tales or Demec Studs to accurately record movement of significant cracks.
- Attachment of levelling targets to monitor settlement.
- The monitoring of the above instrumentation is in accordance with Appendix A. The number and precise locations of instrumentation may change during the works; this shall be subject to agreement with the Principal Contractor (PC).
- All instruments are to be adequately protected against any damage from construction plant or private vehicles using clearly visible markings and suitable head protection e.g. manhole rings or similar. Any damaged instruments are to be immediately replaced or repaired at the contractors own cost.
- Reporting of all data in a manner easily understood by all interested parties.

- Co-ordination of these monitoring works with other site operations to ensure that all instruments can be read and can be reviewed against specified trigger values both during and post construction.
- Regular site meetings by the Principal Contractor (PC) and the Monitoring Surveyor (MS) to review the data and their implications.
- Review of data by Croft Structural Engineers

In addition, the PC will have responsibility for the following:

- Review of methods of working/operations to limit movements, and
- Implementation of any emergency remedial measures if deemed necessary by the results of the monitoring.

The Monitoring Surveyor shall allow for settlement and crack monitoring measures to be installed and monitored on various parts of the structure described in Table 1 as directed by the PC and Party Wall Surveyor (PWS) for the Client.

| Item                  | Instrumentation Type           |  |
|-----------------------|--------------------------------|--|
| Party Wall Brickwork  |                                |  |
| Settlement monitoring | Levelling equipment & targets  |  |
| Crack monitoring      | Visual inspection of cracking, |  |
|                       | Demec studs where necessary    |  |

Table 1: Instrumentation

#### General

The site excavations and substructure works up to finished ground slab stage have the potential to cause vibration and ground movements in the vicinity of the site due to the following:

- a) Removal of any existing redundant foundations / obstructions;
- b) Installation of reinforced concrete retaining walls under the existing footings;
- c) Excavations within the site

The purpose of the monitoring is a check to confirm building movements are not excessive.

This specification is aimed at providing a strategy for monitoring of potential ground and building movements at the site.

This specification is intended to define a background level of monitoring. The PC may choose to carry out additional monitoring during critical operations. Monitoring that should be carried out is as follows:

- a) Visual inspection of the party wall and any pre-existing cracking
- b) Settlement of the party wall

All instruments are to be protected from interference and damage as part of these works.

Access to all instrumentation or monitoring points for reading shall be the responsibility of the Monitoring Surveyor (MS). The MS shall be in sole charge for ensuring that all instruments or monitoring points can be read at each visit and for reporting of the data in a form to be agreed

with the PWS. He shall inform the PC if access is not available to certain instruments and the PC will, wherever possible, arrange for access. He shall immediately report to the PC any damage. The Monitoring Surveyor and the Principal Contractor will be responsible for ensuring that all the instruments that fall under their respective remits as specified are fully operational at all times and any defective or damaged instruments are immediately identified and replaced.

The PC shall be fully responsible for reviewing the monitoring data with the MS - before passing it on to Croft Structural Engineers - determining its accuracy and assessing whether immediate action is to be taken by him and/or other contractors on site to prevent damage to instrumentation or to ensure safety of the site and personnel. All work shall comply with the relevant legislation, regulations and manufacturer's instructions for installation and monitoring of instrumentation.

#### Applicable Standards and References

The following British Standards and civil engineering industry references are applicable to the monitoring of ground movements related to activities on construction works sites:

- 1. BS 5228: Part 1: 1997 Noise and Vibration Control on Construction and Open Sites -Part 1.Code of practice for basic information and procedures for noise and vibration control, Second Edition, BSI 1999.
- 2. BS 5228: Part 2: 1997 Noise and Vibration Control on Construction and Open Sites -Part 2.Guide to noise and vibration control legislation for construction and demolition including road construction and maintenance, Second Edition, BSI 1997.
- 3. BS 7385-1: 1990 (ISO 4866:1990) Evaluation and measurement for vibration in buildings -Part 1: Guide for measurement of vibrations and evaluation of their effects on buildings, First Edition, BSI 1990.
- 4. BS 7385-2: 1993 Evaluation and measurement for vibration in buildings Part 2: Guide to damage levels from ground-borne vibration, First Edition, BSI 1999.
- 5. CIRIA SP 201 Response of buildings to excavation-induced ground movements, CIRIA 2001.

### SPECIFICATION FOR INSTRUMENTATION

#### General

The Monitoring Contractor is required to monitor, protect and reinstall instruments as described. The readings are to be recorded and reported. The following instruments are defined:

- a) Automatic level and targets: A device which allows the measurement of settlement in the vertical axis. To be installed by the MS.
- b) Tell-tales and 3 stud sets: A device which allows measurement of movement to be made in two axes perpendicular to each other. To be installed by the MS.

### Monitoring of existing cracks

The locations of tell-tales or Demec studs to monitor existing cracks shall be agreed with Croft Structural Engineers.

### Instrument Installation Records and Reports

Where instrumentation is to be installed or reinstalled, the Monitoring Surveyor, or the Principal Contractor, as applicable, shall make a complete record of the work. This should include the position and level of each instrument. The records shall include base readings and measurements taken during each monitoring visit. Both tables and graphical outputs of these measurements shall be presented in a format to be agreed with the CM. The report shall include photographs of each type of instrumentation installed and clear scaled sections and plans of each instrument installed. This report shall also include the supplier's technical fact sheet on the type of instrument used and instructions on monitoring.

Two signed copies of the report shall be supplied to the PWS within one week of completion of site measurements for approval.

### Installation

All instruments shall be installed to the satisfaction of the PC. No loosening or disturbance of the instrument with use or time shall be acceptable. All instruments are to be clearly marked to avoid damage.

All setting out shall be undertaken by the Monitoring Surveyor or the Principal Contractor as may be applicable. The precise locations will be agreed by the PC prior to installation of the instrument.

The installations are to be managed and supervised by the Instrumentation Engineer or the Measurement Surveyor as may be applicable.

### Monitoring

The frequencies of monitoring for each Section of the Works are given in Appendix A.

The following accuracies/ tolerances shall be achieved:

Party Wall settlement Crack monitoring <u>+</u>1.5mm <u>+</u>0.75mm

### REPORT OF RESULTS AND TRIGGER LEVELS

#### General

Within 24 hours of taking the readings, the Monitoring Surveyor will submit a single page summary of the recorded movements. All readings shall be immediately reviewed by Croft Structural Engineers prior to reporting to the PWS.

Within one working day of taking the readings the Monitoring Contractor shall produce a full report (see below).

The following system of control shall be employed by the PC and appropriate contractors for each section of the works. The Trigger value, at which the appropriate action shall be taken, for each section, is given in Table 2, below.

The method of construction by use of sequential piles limits the deflections in the party wall.

Between the trigger points, which are no greater than 2 m apart, there should be no more than:

Allowable movement to BS5950 for brittle finishes

| <u>Vertical</u>                                       | = | Span / 360 | = | 4000mm / 360 | = | 11.1mm     |  |  |
|---|---|------------|---|--------------|---|------------|--|--|
| Croft proposes a tighter recommendation of Span / 500 |   |            |   |              |   |            |  |  |
|   | = | Span / 900 | = | 4000mm / 900 | = | <u>4mm</u> |  |  |

Above Monitoring Level 3, lateral movement is required to be measured and the figures should be:

<u>Horizontal</u> = Height / 500 = 5000mm / 500 = 10mm

Croft proposes a tighter recommendation of = Height / 900 = 5000mm / 900 = 5mm

The reference height is the sum of the depth of the excavation (3.5m) and the position of the monitoring stud above ground level (1.5m). For the pool excavation (6m deep) the lateral movement limits are as follows:

<u>Horizontal</u> = Height / 500 = 7500mm / 500 = 15mm

Croft proposes a tighter recommendation to match the excavation of the rest of the basement, i.e. 5mm.

9

During works measurements are taken, these are compared with the limits set out below:

| MOVEMENT |            | CATEGORY | ACTION   |  |
|----------|------------|----------|--|--|
| Vertical | Horizontal |          |  |  |
| 0mm-4mm  | 0-5mm      | Green    | No action required   |  |
| 4mm-7mm  | 5-7mm      | AMBER    | Detailed review of Monitoring:<br>Check studs are OK and have not moved. Ensure site<br>staff have not moved studs. If studs have moved<br>reposition. |  |
|          |            |          | Relevel to ensure results are correct and tolerance is not a concern.  |  |
|          |            |          | Inform Party Wall surveyors of amber readings.   |  |
|          |            |          | Double the monitoring for 2 further readings. If stable revert back.   |  |
|          |            |          | Carry out a local structural review and inspection.  |  |
|          |            |          | Preparation for the implementation of remedial measures should be required.  |  |
|          |            |          | Double number of lateral props   |  |
| 7mm-10mm | 7-9mm      |          | Implement remedial measures review method of working and ground conditions   |  |
| >10mm    | >9mm       | RED      | Implement structural support as required;  |  |
|          |            |          | Cease works with the exception of necessary works for<br>the safety and stability of the structure and personnel;                                      |  |
|          |            |          | Review monitoring data and implement revised method of works   |  |

Table 2 – Movement limits between adjacent sets of Tell-tales or stud sets

Any movements which exceed the individual amber trigger levels for a monitoring measure given in Table 2 shall be immediately reported to the PWS, and a review of all of the current monitoring data for all monitoring measures must be implemented to determine the possible causes of the trigger level being exceeded. Monitoring of the affected location must be increased and the actions described above implemented. Assessment of exceeded trigger levels must <u>not</u> be carried out in isolation from an assessment of the entire monitoring regime as the monitoring measures are

10

inter-related. Where required, measures may be implemented or prepared as determined by the specific situation and combination of observed monitoring measurement data.

### Standard Reporting

1 No. electronic copy of the report in PDF format shall be submitted to the PWS.

The Monitoring Surveyor shall report whether the movements are within (or otherwise) the Trigger Levels indicated in Table 2. A summary of the extent of completion of any of the elements of works and any other significant events shall be given. These works shall be shown in the form of annotated plans (and sections) for each survey visit both local to the instrumentation and over a wider area. The associated changes to readings at each survey or monitoring point shall be then regulated to the construction activity so that the cause of any change, if it occurs, can be determined.

The Monitoring Surveyor shall also give details of any events on site which in his opinion could affect the validity of the results of any of the surveys.

The report shall contain as a minimum, for each survey visit the following information:

- a) The date and time of each reading:
- b) The weather on the day:
- c) The name of the person recording the data on site and the person analysing the readings together with their company affiliations;
- d) Any damage to the instrumentation or difficulties in reading;
- e) Tables comparing the latest reading with the last reading and the base reading and the changes between these recorded data;
- f) Graphs showing variations in crack width with time for the crack measuring gauges; and
- g) Construction activity as described. It is very important that each set of readings is associated with the extent of excavation and construction at that time. Readings shall be accompanied by information describing the extent of works at the time of readings. This shall be agreed with the PC.

Spread-sheet columns of numbers should be clearly labelled together with units. Numbers should not be reported to a greater accuracy than is appropriate. Graph axis should be linear and clearly labelled together with units. The axis scales are to be agreed with the PC before the start of monitoring and are to remain constant for the duration of the job unless agreed otherwise. The specified trigger values are also to be plotted on all graphs.

The reports are to include progress photographs of the works both general to the area of each instrument and globally to the main Works. In particular, these are to supplement annotated plans/sections described above. Wherever possible the global photographs are to be taken from approximately the same spot on each occasion.

#### Erroneous Data

All data shall be checked for errors by the Monitoring Surveyor prior to submission. If a reading that appears to be erroneous (i.e. it shows a trend which is not supported by the surrounding instrumentation), he shall notify the PC immediately, resurvey the point in question and the

neighbouring points and if the error is repeated, he shall attempt to identify the cause of the error. Both sets of readings shall be processed and submitted, together with the reasons for the errors and details of remedial works. If the error persists at subsequent survey visits, the Monitoring Surveyor shall agree with the PC how the data should be corrected. Correction could be achieved by correcting the readings subsequent to the error first being identified to a new base reading.

The Monitoring Surveyor shall rectify any faults found in or damage caused to the instrumentation system for the duration of the specified monitoring period, irrespective of cause, at his own cost.

### Trigger Values

Trigger values for maximum movements as listed in Table 2. If the movement exceeds these values then action may be required to limit further movement. The PC should be immediately advised of the movements in order to implement the necessary works.

It is important that all neighbouring points (not necessarily a single survey point) should be used in assessing the impact of any movements which exceed the trigger values, and that rechecks are carried out to ensure the data is not erroneous. A detailed record of all activities in the area of the survey point will also be required as specified elsewhere.

### Responsibility for Instrumentation

The Monitoring Surveyor shall be responsible for: managing the installation of the instruments or measuring points, reporting of the results in a format which is user friendly to all parties; and immediately reporting to all parties any damage. The Monitoring Surveyor shall be responsible for informing the PC of any movements which exceed the specified trigger values listed in Table 2 so that the PC can implement appropriate procedures. He shall immediately inform the PWS of any decisions taken.

### APPENDIX A MONITORING FREQUENCY

| INSTRUMENT                 | FREQUENCY OF READING                                     |
|----------------------------|--|
| Settlement monitoring      | Pre-construction   |
| and                        | Monitored once.  |
| Monitoring existing cracks | During construction                                      |
|                            | Monitored after every pile is cast for first 4 no. piles |
|                            | to gauge effect of piling. If all is well, monitor after |
|                            | every other pile.  |
|                            | Post construction works                                  |
|                            | Monitored once.  |

# APPENDIX B

# An Analysis on allowable settlements of structures (Skempton and MacDonald (1956))

The most comprehensive studies linking self-weight settlements of buildings to structural damage were carried out in the 1950's by Skempton and MacDonald (1956) and Polshin and Tokar. These studies show that damage is most often caused by differential settlements rather than absolute settlements. More recently, similar empirical studies by Boscardin and Cording (1989) and Boone (1996) have linked structural damage to ground movements induced by excavations and tunnelling activities.

In 1955 Skempton and MacDonald identified the parameter  $\delta \rho/L$  as the fundamental element on which to judge maximum admissible settlements for structures. This criterion was later confirmed in the works of GRANT *et al.* [1975] and WALSH [1981]. Another important approach to the problem was that of BURLAND and WROTH [1974], based on the criterion of maximum tensile strains.

Figure 2.1 – Diagram illustrating the definitions of maximum angular distortion,  $\delta/l$ , maximum settlement,  $\rho_{max}$ , and greatest differential settlement,  $\Delta$ , for a building with no tilt (Skempton and MacDonald, 1956).

Figure 1: Diagram illustrating the definitions of maximum angular distortion,  $\delta/I$ , maximum settlement,  $p_{max}$ , and greatest differential settlement , $\Delta$  , for a building with no tilt (Skempton and MacDonald, 1956)

The differential settlement is defined as the greatest vertical distance between two points on the foundation of a structure that has settled, while the angular distortion, is the difference in elevation between two points, divided by the distance between those points.

Job Number: 150607 Date: 2 December 2015

Figure 2: Skempton and MacDonald's analysis of field evidence of damage on traditional frame buildings and loadbearing brick walls

Data from Skempton and MacDonald's work suggest that the limiting value of angular distortion is 1/300. Angular distortion, greater than 1/300 produced visible cracking in the majority of buildings studied, regardless of whether it was a load bearing or a frame structure. As shown in the figure 2.

Dear John,

Thanks for taking my calls.

As discussed we are working on the planning application for a basement for a new build property at the above address.

Please find attached the extract from Groundsure which has our property marked. The Jubilee line appears to run close by and this may be one or all of the tracks indicated on the attachment. Please could you provide us with a better indication of horizontal distance and depth of the nearest LUL tunnel, to our site. If applicable, please could you also confirm the extent to which LUL will need to be involved in the development, from planning stage and beyond.

#### Kind regards

#### **Geoff Watson**

Structural Engineer

Plot of Jubilee line as requested, it shows the approximate centre line of tunnels. Dependant upon what your proposals are you may need a correlation survey to accurately plot the tunnel location.
