Cycle Wheel Ramp

The VeloComfort® is a new range of cycle products designed to help cyclists manoeuvre their bikes up and down stairs with virtually no effort. The VeloComfort® range comes in two innovative designs, one for manoeuvring bicycles up the stairs and one for down. The VeloComfort® is modular and can fit any cycle tread depth and most stair angles where there is a steep slope (> 22°). The VeloComfort® is suitable for indoor and outdoor use.

Traditionally bike 'wheel gutters' have been employed to help cyclists negotiate steps, but these do not consider the weight of the bike which can 'run away' when going down stairs or be a strain when pushing up. These two new products solve both of these problems, limit 'manual handling' issues and are a real aid for the transportation of bikes on stairs, steps or even slopes. Ideal for areas such as railway stations or shopping centres where there is a large throughput of cyclists.
