Greenfield Analysis																																				
Assumed as greenfield runoff rate																																				
	Hydrological Region:	6																																		
	Soil Type	2																																		
	Development Size	0.017 ha																																		
	Annual Rainfall (SAAR)	605 mm																																		
	Soil Runoff Coefficient (SPR)	0.3																																		
Development area under 50 ha, therefore calculate Q_{BAR50} and linearly interpolate																																				
$Q_{BAR50} = 1.08(A/100)^{0.89} \times SAAR^{1.17} \times SPR^{2.17}$																																				
	Q_{BAR50}	76.83 l/s																																		
	Q_{BAR}	0.03 l/s																																		
Calculate Q for different return periods using growth curve value for region 10 (GC)
