REPORT NOTES

Equipment Used:

Hand tools, mechanical concrete breaker & spade, hand augers and 100mm diameter open bored continuous flight auger (access permitting)

Insitu tests:

By Pilcon hand shear vane tester (kN/m²) in clay soils, and or Mackintosh probe penetration test(blows per 75mm) in granular soil or made ground.

Soil description:

Soil descriptions are on-site descriptions only.

Tree roots:

Tree roots relate to tree roots observed in trial pits and boreholes only.

Note:

Details reported in trial pits and boreholes relate to positions investigated only, as instructed by the client, on the date shown only. We therefore do not accept any responsibility for changes in soil conditions not investigated any variations due to climate, seasons, vegetation and varying ground water levels.

Full terms and conditions are available upon request.

26/04/2017

Dear Sirs

12 Akenside Road, London

The samples you sent in relation to the above on 12/04/2017 (received by us on 20/04/2017) have been examined. The structure was referable as follows:

TP1, u/s foundation

1 root: PLATANUS (Plane). 5 further samples, not examined in detail appeared similar under low magnification. Dead*.

1 root: a SHRUB, similar in many ways to BUDDLEJA (bushes, sometimes large, with spikes consisting of tiny pink, white or blue scented flowers). 7 further samples, not examined in detail appeared similar under low magnification. Dead*.

BH1, 1.5-2.3m

1 root: PLATANUS (Plane). 4 further samples, not examined in detail appeared similar under low magnification. Dead*.

5 samples: unfortunately insufficient cells for identification.

TP3, u/s foundation

1 root: PLATANUS (Plane). 2 further samples, not examined in detail appeared similar under low magnification. Dead*.

I trust this is of help. Please call us if you have any queries; our Invoice is enclosed.

Yours faithfully

Dr Ian B K Richardson

* Based mainly on the Iodine test for starch. Starch is present in some cells of a living woody root, but is more or less rapidly broken down by soil micro-organisms on death of the root, sometimes before decay is evident. This result need not reflect the state of the parent tree.
