53 Fitzroy Park London N6 6JA

MAINTENANCE NOTES

All ground preparation and planting to be carried out to British Standards as stipulated in the John Heather Landscape Specification 2015. This will ensure that all new plantings get off to the best possible start.

GARDEN IRRIGATION

Micro irrigation systems with battery or mains operated controllers will be installed to ensure that all semimature tree stock, hedging and new planting will be irrigated regularly until properly established. For the
semi-mature trees this will be a period of at least two years. After this time we would recommend that the
client keeps the system in place though may use it on a much reduced basis. The controller should be
disconnected in late autumn and brought inside to avoid frost damage.

WILDFLOWER MEADOW

- On installation this product should be watered according to the attached guidelines.
- The meadow should be cut right back and cuttings removed in Autumn

GREEN ROOF

- On installation this product should be watered according to the attached guidelines.
- The roof area should be generally kept clear of weeds to prevent plant encroachment
- The meadow should be cut back to a height of around 50mm and cuttings removed in Autumn
- March/April apply 80g / M2 dressing of Bauder slow release organic fertiliser
- An irrigation system may be set up in order to get the best display possible from this meadow. However, it is also adequate to just provide watering points so that the meadow may be irrigated in periods of drought. If neither of the above is arranged, then the meadow may fail in extended periods of drought.

MULCHING

 All planting (with the exception of wild flower meadows) will be mulched after installation using MixOrMulch supplied by Thompsons of Crews Hill. This product not only helps to retain moisture within the soil but also conditions the soil as it contains fenland soil and manure as well as composted bark and leaf mould. We recommend annual mulching either in Autumn or spring to promote the health of soil and maintain the health and appearance of all planting.

HEDGING, PLEACHED TREES AND TOPIARY

- Beech hedging and pleached trees on the boundary, taxus hedging and domes in the rear garden will be clipped annually to retain the required height and neat appearance.
- Taxus may then be clipped again in the Autumn if required.

53 Fitzroy Park London N6 6JA

PLANTERS

- All planters will be irrigated either by micro irrigation lines or by plantsava reservoirs supplied by Greentech.
 These reservoirs store water underneath the rootball of the plant so that the plant may take up water via
 capillary action as and when it needs it. This does mean that the tanks need to be filled every so often but is
 a viable and optional alternative to micro drip lines and also avoids excess water from leaking out of the
 bottom of the planter.
- In order to maintain the health of these plants a liquid fertiliser should be applied annually in spring.

TREES

- Maintenance of trees to be in accordance with guidelines of BS8545:2014
- As mentioned above, all semi-mature stock should be irrigated on a regular basis until completely established. This will take a minimum of two years.
- We also recommend that all trees planted should be managed on a mid to long term basis as so often we see damage caused to landscapes and even buildings by trees that have been allowed to grow without any management. We recommend that a tree surgeon should carry out formative pruning as well as pruning out of dead wood etc at least once every four to five years. This is not to formalise the trees but simply to maintain a balanced and healthy crown. As we are in a conservation area, each visit would be preceded by an application to Camden Council who would ultimately regulate the frequency of this maintenance.

MAINTENANCE OF HERBACEOUS PLANTS AND SHRUBS

The planting palettes for this garden have been designed to be relatively low maintenance featuring a backbone of trees and shrubs around which is woven a mixture of flowering perennials and ornamental grasses. Maintenance tasks are as follows:

- At the end of the season old flower stems are cut back down to the ground. This gives room for the new shoots to emerge. Some plants are left over winter because they offer some interesting winter structure.
 These must be cut back no later than the beginning of February as new shoots emerge the following spring.
- Weeds can be a big problem amongst herbaceous plants as they will grow up through the clumps and are
 not easily removed without damaging the plant. Herbicides cannot be used as, unless the weeds are very
 carefully spot-treated, they will damage herbaceous growth. Hand weeding is done throughout the summer.
 If a weed problem becomes very bad the clumps are lifted out of the ground. The weeds can then be cleared
 from amongst the roots, and from the ground, before replanting.
- Herbaceous plants in the border need nutritious ground. The best source of this is composted waste or rotted manure. However, this sometimes introduces more weed seeds. Fertilizers applied in the spring will improve plant growth.

53 Fitzroy Park London N6 6JA

- Mulching herbaceous plants in the spring helps to conserve water and suppress weed growth. The best
 materials for mulching are composted garden waste, leaf mould or well rotted manure. These will also add
 nutrients to the ground. Bark or composted bark can also be used. Fresh manure should not be used as it will
 scorch young soft shoots of herbaceous plants.
- Removing the flower heads as they mature will encourage the plant to produce more flowers and extend the flowering period. In most cases this is done with secateurs to individual flower stems. Some plants can be cut back with shears after flowering to encourage more growth and a repeat flush of flowers. Crowded stems can be pinched right out before flowering to thin the number of flowers if necessary.
- In spring or autumn large clumps will need to be lifted out of the ground and divided into smaller plants which can then be replanted. The frequency with which this is done will depend on the vigour of the plant but is normally every 3 to 4 years. Fibrous rooted perennials are lifted and split apart with two forks back to back. Early flowering plants are divided in the autumn and late flowering plants are divided in the spring. Fleshy rooted plants, such as hostas, are lifted and split apart with a spade or a knife in the spring. The older part of the lifted plant in the middle is discarded and the younger plants from the outside are replanted.

LAWN MAINTENANCE

General tasks for maintaining a high quality lawn are as follows:

- Apply a top dressing in Spring and start mowing as warmer weather stimulates turf growth. Once over a year old, the lawn may be scarified at this time and any weeds removed either by hand or by spot treatment.
- The lawn should be mown regularly over the summer period.
- In the autumn the lawn may be scarified and aerated. It may also be fed with a fertiliser such as Rolawn GroRight Lawn fertiliser, weed and moss killer.

53 Fitzroy Park London N6 6JA

MAINTENANCE PLAN

Based on the design of the garden we would recommend garden maintenance to be carried out by a team on at the very least a bi-monthly basis, with extra visits scheduled during the summer for lawn mowing if required.

FREQUENCY OF VISITS

March to October	Fortnightly	16
November to February	Monthly	4
Total visits per annum		20

DUTIES TO BE CARRIED OUT UPON EVERY VISIT:

- Cut all grassed areas
- Weed all flower and shrubbery beds
- Remove litter
- Remove all fallen leaves and branches
- Edge lawns
- Sweep and clean all paths, roadways and parking spaces

DUTIES TO BE CARRIED OUT EVERY THREE MONTHS:

- Treat weeds (such as ground elder, thistle, dandy lions) and notify owner of invasive weeds (such as
 Japanese Knotweed/Himalayan Balsam etc) immediately upon identification
- Keep all plantings tidy. This may include removal of spent growth if not being retained to stand over winter.
 Plant grass seed on any bare patches, especially after moss removal.
- Apply weed killer on paths, driveways and parking areas to kill off weeds and moss. Remove arising as a result of treatment.

DUTIES TO BE CARRIED OUT ANNUALLY:

Mulching in mid to late Spring once soil has warmed up

53 Fitzroy Park London N6 6JA

- Pruning of pleached trees to retain shape
- Pruning of domes / topiary forms to retain shape
- Cutting back of all wild flower meadows in the Autumn
- Application of dressing of slow release fertiliser to Green roof in Spring
- Cutting back of spent material either in late Autumn or February depending on how well it will stand over winter.
