This report is intended as a Ground Investigation Report (GIR) as defined in BS EN1997-2, unless specifically noted otherwise. The report is not a Geotechnical Design Report (GDR) as defined in EN1997-2 and recommendations made within this report are for guidance only.

CONTENTS

Part 3: GROUND MOVEMENT ASSESSMENT

Part 4: BASEMENT IMPACT ASSESSMENT

EXECUTIVE SUMMARY

This executive summary contains an overview of the key findings and conclusions. No reliance should be placed on any part of the executive summary until the whole of the report has been read. Other sections of the report may contain information that puts into context the findings that are summarised in the executive summary.

BRIEF

This report describes the findings of a site investigation carried out by Geotechnical and Environmental Associates Limited (GEA) on the instructions of Michael Barclay Partnership LLP, on behalf of Sue Prevezer, with respect to remodelling of the existing house, including the construction of a single storey extension at the front and the rear and a single storey basement at the front of the house. The purpose of the investigation has been to determine the ground conditions and hydrogeology, to carry out an assessment of ground movements resulting from excavation of the proposed basement, to assess the extent of any contamination and to provide information to assist with the design of the basement structure and suitable foundations. The report also includes information required to comply with London Borough of Camden Planning Guidance, relating to the requirement for a Basement Impact Assessment (BIA).

DESK STUDY FINDINGS

The desk study has indicated that the site does not have a potentially contaminative history as it has apparently only been developed with the existing house. There is, therefore, assessed to be a VERY LOW RISK of contamination at this site.

GROUND CONDITIONS

The investigation has confirmed the expected ground conditions in that, beneath a nominal thickness of made ground, London Clay was encountered and proved to the full depth of the investigation. The made ground comprised dark brown slightly clayey gravelly sand with fragments of concrete and bricks and extended to depths of between 0.30 m (7.50 m TBM) and 1.20 m (6.60 m TBM). The London Clay comprised firm becoming stiff occasionally mottled bluish grey becoming greyish brown silty clay with selenite crystals and selenite crystals to the full depth investigated, of 6.50 m (1.30 m TBM).

Groundwater was not encountered during the fieldwork. Standpipes were installed in Borehole Nos 1 and 2 and have been monitored on a single occasion to date, measuring groundwater at depths of 1.30 m (6.50 m TBM) and 5.45 m (2.35 m TBM), probably reflecting the accumulation of perched water. Additional monitoring should be carried out.

Contamination testing has revealed a single elevated concentration of lead within made ground recovered from the existing rear garden.

RECOMMENDATIONS

Formation level for the proposed basement is likely to be within the firm to stiff clay of the London Clay, which should provide an eminently suitable bearing stratum for spread foundations. Excavations for the proposed basement structure will require temporary support to maintain stability and to prevent any excessive ground movements. Perched water may be encountered but significant groundwater inflows are not anticipated.

Site workers should adopt suitable precautions when handling soil and areas of new soft landscaping / planting may need to be formed with a cover thickness of imported soils.

BASEMENT IMPACT ASSESSMENT

The BIA has not indicated any concerns with regard to the effects of the proposed basement on the site and surrounding area. It has been concluded that the impacts identified can be mitigated by appropriate design and standard construction practice.

Part 1: INVESTIGATION REPORT

This section of the report details the objectives of the investigation, the work that has been carried out to meet these objectives and the results of the investigation. Interpretation of the findings is presented in Part 2 and an assessment of the ground movements associated with the basement excavation are included in Part 3.

1.0 INTRODUCTION

Geotechnical and Environmental Associates Limited (GEA) has been commissioned by Michael Barclay Partnership LLP, on behalf of Sue Prevezer, to carry out a desk study, ground investigation and ground movement assessment at 40 Ornan Road, London, NW3 4QB.

This report also forms part of a Basement Impact Assessment (BIA), which has been carried out in accordance with guidelines from the London Borough of Camden (LBC) in support of a planning application.

1.1 Proposed Development

It is understood that it is proposed to construct a single storey extension at the front and the rear and a single-storey basement. The basement levels are proposed to extend to approximately 3.00 m below existing ground floor level.

This report is specific to the proposed development and the advice herein should be reviewed if the proposals are amended.

1.2 Purpose of Work

The principal technical objectives of the work carried out were as follows:

- to check the history of the site with respect to previous contaminative uses;
- to provide an assessment of the risk associated with Unexploded Ordnance (UXO);
- to determine the ground conditions and their engineering properties;
- to provide advice and information with respect to the design of suitable foundations and retaining walls;
- to assess the impact of the proposed basement on the local hydrogeology, hydrology and stability of the surrounding natural and build environment;
- to provide an indication of the degree of soil contamination present; and
- to assess the risk that any such contamination may pose to the proposed development, its users or the wider environment.

1.3 Scope of Work

In order to meet the above objectives, a desk study was carried out, followed by a ground investigation. The desk study comprised:

- a review of historical Ordnance Survey (OS) maps and environmental searches sourced from the Envirocheck database;
- a review of readily available geology maps;
- a walkover survey of the site carried out in conjunction with the fieldwork;
- commissioning of 1st Line Defence to undertake a preliminary UXO risk assessment;

In light of this desk study an intrusive ground investigation was carried out which comprised, in summary, the following activities:

- two boreholes advanced to a depth of 6.50 m using an opendrive percussive sampler (Terrier) rig;
- three boreholes advanced to a depth of 3.50 m using window sampling equipment;
- installation of three groundwater monitoring standpipes, to a maximum depth of 5.00 m, and three monthly monitoring visits;
- testing of selected soil samples for contamination and geotechnical purposes;
- provision of a report presenting and interpreting the above data, together with our advice and recommendations with respect to the proposed development.

The report includes a contaminated land assessment which has been undertaken in accordance with the methodology presented in Contaminated Land Report (CLR) 11[1] and involves identifying, making decisions on, and taking appropriate action to deal with, land contamination in a way that is consistent with government policies and legislation within the United Kingdom. The risk assessment is thus divided into three stages comprising Preliminary Risk Assessment, Generic Quantitative Risk Assessment, and Site-Specific Risk Assessment.

The exploratory methods adopted in this investigation have been selected on the basis of the constraints of the site including but not limited to access and space limitations, together with any budgetary or timing constraints. Where it has not been possible to reasonably use an EC7 compliant investigation technique a practical alternative has been adopted to obtain indicative soil parameters and any interpretation is based upon engineering experience, local precedent where applicable and relevant published information.

1.3.1 Basement Impact Assessment

The work carried out includes a Hydrological and Hydrogeological Assessment and Land Stability Assessment (also referred to as Slope Stability Assessment). These assessments form part of the BIA procedure specified in the London Borough of Camden (LBC) Planning Guidance CPG[2] and their Guidance for Subterranean Development[3] prepared by Arup (the "Arup report") in accordance with Policy A5 of the Camden Local Plan 2017. The aim of the work is to provide information on surface water, groundwater and land stability and in particular to assess whether the development will affect neighbouring properties or groundwater movements and whether any identified impacts can be appropriately mitigated by the design of the development.

3 Ove Arup & Partners (2010) *Camden geological, hydrogeological and hydrological study. Guidance for Subterranean Development.* For London Borough of Camden November 2010

1.3.2 Qualifications

The subterranean (groundwater) flow assessment has been carried out by John Evans, MSc in Hydrogeology, Chartered Geologist (CGeol) and Fellow of the Geological Society of London (FGS). The surface water and flooding assessment has been carried out by Rupert Evans, a hydrologist with more than ten years consultancy experience in flood risk assessment, surface water drainage schemes and hydrology / hydraulic modelling. Rupert Evans is a Chartered Environmentalist, Chartered Water and Environmental Manager and a Member of CIWEM.

The assessments have been made in conjunction with Steve Branch, a BSc in Engineering Geology and Geotechnics, MSc in Geotechnical Engineering, a Chartered Geologist (CGeol) and Fellow of the Geological Society (FGS) with some 30 years' experience in geotechnical engineering and engineering geology.

All assessors meet the qualification requirements of the Council guidance.

1.4 Limitations

The conclusions and recommendations made in this report are limited to those that can be made on the basis of the investigation. The results of the work should be viewed in the context of the range of data sources consulted, the number of locations where the ground was sampled and the number of soil, gas or groundwater samples tested; no liability can be accepted for information in other data sources or conditions not revealed by the sampling or testing. Any comments made on the basis of information obtained from the client or other third parties are given in good faith on the assumption that the information is accurate; no independent validation of such information has been made by GEA.

2.0 THE SITE

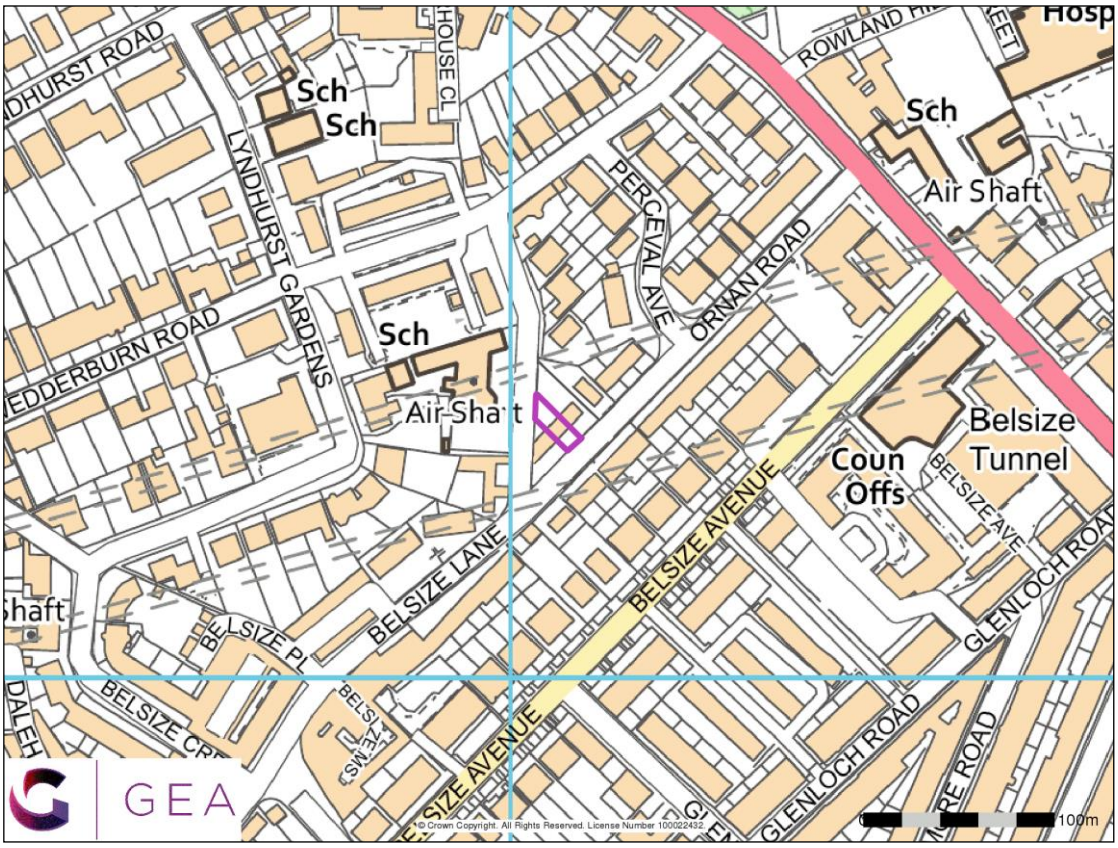
2.1 Site Description

The site is located in the London Borough of Camden, roughly 500 m west of Belsize Park Station. It is rectangular in shape, measuring approximately 30 m northwest to southeast by 10 m north to south and is occupied by a residential dwelling with front and rear gardens.

The site fronts onto Ornan Road to the south and is bordered by Belsize Lane to the north and northwest and with residential structures located to the immediate east and west. The site may additionally be located by National Grid Reference 527041, 185147 and is shown on the map extract overleaf.

It is understood that the house was originally of two storeys, but a third storey was added in 2004. The front area of the house consists a courtyard with a cockspur thorn overhanging the street. The house has two garages, one of which is integrated into the house, with off-street parking and private walled gardens at the front and rear, facing southeast and northwest respectively. The back area of the house slopes towards the south and consists of a garden with stepped paving slabs leading to the second garage.

London Overground tunnels are present approximately 20 m to the north and south of the site. The exact depth of the tunnels is not known, although information obtained from a nearby site suggests that they are in excess of 25 m below ground level and should not therefore be affected by the proposed development. This should, however, be confirmed with Network Rail before the design proposals are finalised.



2.2 Site History

The history of the site and surrounding area has been researched by reference to archive historical maps and Ordnance Survey (OS) maps sourced from the Envirocheck database.

The earliest map studied, dated 1871, shows the site to be undeveloped, covered with fields. The existing road network around the site had been established, although the roads are unnamed.

The next map, dated 1896, shows that the existing row of terraced properties, including a building on the site had been established. The majority of the surrounding area was predominantly residential, much as it is today.

For the following years, until 1969 the site remained unchanged, with more residential buildings added to the surrounding area. By 1970 the property on site appears to be have been demolished.

The existing house was built at some time between 1970 and 1974 and the site and the surrounding area have since remained essentially unchanged.

2.3 Other Information

A search of public registers and databases has been made via the Envirocheck database and relevant extracts from the search are appended. Full results of the search can be provided if required.

The search has revealed that there are no landfills, waste management, transfer, treatment or disposal sites within 1 km of the site. There have been no pollution incidents to controlled waters within 250 m of the site.

There are no areas of infilled land recorded within 100 m of the site and no contemporary trade industries within 100 m of the site, or any points of interest and fuel stations.

The search has indicated that the site is located in an area where less than 1% of homes are affected by radon emissions; which is the lowest classification given by the Health Protection Agency (HPA) and therefore no radon protective measures will be necessary.

The site is not located within a nitrate vulnerable zone or any other sensitive land use.

2.4 Geology

The British Geological Survey (BGS) map of the area (Sheet 256) indicates the site is directly underlain by the London Clay. It is however, also in an area of head propensity such that head deposits may also be present over the London Clay.

According to the BGS memoir, the London Clay is homogenous, slightly calcareous silty clay to very silty clay, with some beds of clayey silt grading to silty fine-grained sand.

GEA previously undertook an assessment for a property off Lyndhurst Gardens, approximately 50 m to the west of the site, and information provided as part of this project from a previous investigation, confirmed the expected ground conditions, in that, beneath a variable, but generally nominal, thickness of made ground, London Clay was encountered and proved to the full depth of the investigation of 15.0 m.

A review of deep borehole records held on the British Geological Society (BGS) database, the closest of which is located 400 m to the east of the site, indicates that the London Clay is likely to extend to a depth of approximately 70 m beneath the site, below which the Lambeth Group, Thanet Sand and Upper Chalk were found to be present.

2.5 Hydrology and Hydrogeology

The London Clay is classified by the Environment Agency (EA) as an Unproductive Stratum, referring to rock layers or drift deposits with low permeability that have negligible significance for water supply or river base flow.

The London Clay is not capable of supporting a groundwater table, although isolated pockets of perched groundwater do occur within fissures and silt and sand partings. Published data for the permeability of the London Clay indicates the horizontal permeability to generally range between 1×10^{-11} m/s and 1×10^{-9} m/s, with an even lower vertical permeability.

According to BGS, the site is in an area of head propensity and therefore head deposits may be present, which are likely to be of higher permeability and to contain layers of coarser grained soils that could hold water but are unlikely to contain continuous layers capable of transmitting groundwater due to the clay dominated matrix.

The investigation reviewed as part of the GEA assessment for the aforementioned site above, did not encounter any groundwater.

The site is not indicated as being at risk from flooding, nor is it located within a Groundwater Source Protection Zone as defined by the Environment Agency. It is not listed within the London Borough of Camden report[4] as having suffered from surface water flooding in the 1975 or 2002 flooding events and is not shown on Figure 15 of the Arup report[5], or the EA surface water flood maps, as being in an area with a potential risk from surface water flooding.

Figure 11 of the Arup report and reference to Map 14 of the Lost Rivers of London[6] indicates that a tributary of the River Tyburn, rose approximately 125 m to the east of the site, before flowing in a southerly direction towards Regent's Park. The nearest surface water feature is the Hampstead No 1 Pond, 800 m to the northeast of the site.

The existing back garden is almost entirely covered by grass and as such, infiltration of rainwater is largely unimpeded. However, the underlying clay will limit further infiltration, therefore resulting in a high proportion of runoff in this area. The front of the property is largely covered by tarmac hardstanding, such that infiltration of rainwater is therefore generally restricted to surface water drains, such that the majority of surface runoff currently drains into combined sewers in the road.

As the development does not result in a change to the present conditions, for example through the loss of any soft covered areas, there will not be an increase in runoff rate or volume into the existing sewer system, or that could have a potentially adverse impact on the surrounding area. There should not, therefore, be any requirement for any surface water related mitigation measures.

2.6 Preliminary Risk Assessment

Part IIA of the Environmental Protection Act 1990, which was inserted into that Act by Section 57 of the Environment Act 1995, provides the main regulatory regime for the identification and remediation of contaminated land. The determination of contaminated sites is based on a "suitable for use" approach which involves managing the risks posed by contaminated land by making risk-based decisions. This risk assessment is carried out on the basis of a source-pathway-receptor approach.

2.6.1 Source

The desk study research has indicated that the site has had a residential end use for its entire developed history and is therefore not considered to have had a contaminative history.

There are no historical or existing landfill sites within 500 m of the site and therefore there is not a risk to the site from migrating landfill gas.

2.6.2 Receptor

The occupants of the house will represent relatively high sensitivity receptors. Buried services are likely to come into contact with any contaminants present within the soils through which they pass, and site workers are likely to come into contact with any contaminants present during construction works.

Perched water may be present in the made ground or head deposits, particularly in the vicinity of existing foundations, although such pockets of water are likely to be localised and unlikely to form part of a general water table.

5 Ove Arup & Partners (2010) *Camden geological, hydrogeological and hydrological study. Guidance for Subterranean Development.* For London Borough of Camden November 2010
6 Nicholas Barton and Stephen Myers (2016) *London's Lost Rivers. Revised Edition.* Historical Publications Ltd

2.6.3 Pathway

Within the site, end users will be isolated from direct contact with any contaminants present within the made ground by the building and surrounding hard surfacing, thus no potential contaminant exposure pathways will exist with respect to end users. Only in areas of proposed soft landscaping will end users potentially come into contact with contaminants, although such pathways are already in existence.

There will be a potential for contaminants to move onto or off the site horizontally within the made ground, although these pathways are already in existence. A pathway for ground workers to come into contact with any contamination will exist during construction work and services will come into contact with any contamination within the soils in which they are laid.

There is thus considered to be a low potential for a contaminant pathway to be present between any potential contaminant source and a target for the particular contaminant.

2.6.4 Preliminary Risk Appraisal

On the basis of the above it is considered that there is a VERY LOW risk of there being a significant contaminant linkage at this site, which would result in a requirement for major remediation work. Furthermore, as there is no evidence of filled ground within the vicinity of the site and no landfill sites, there is not considered to be a significant potential for hazardous soil gas to be present on or migrating towards the site.

2.7 UXO Risk Assessment

A Preliminary UXO Risk Assessment has been completed by 1st Line Defence (report ref EP9743-00, dated September 2019), and a copy of the report is included in the appendix.

The risk assessment has been carried out in accordance with the guidelines provided by CIRIA[7], which state that the likelihood of encountering and detonating UXO below a site should be assessed along with establishing the consequences that may arise. The first phase comprises a preliminary risk assessment, which should be undertaken at an early stage of the development planning. If such an assessment identifies a high level of risk then a detailed risk assessment should be carried out by a UXO specialist, which will identify an appropriate course of action with regard to risk mitigation.

During World War II (WWII) the site was located within the Metropolitan Borough of Hampstead which sustained a high bombing density according to official statistics. London Bomb Census mapping indicates no bombs landed on the site directly, although a high explosive bomb impacted to the immediate west and an incendiary shower was recorded over the area. The two buildings on site were labelled as having ‘blast damage, minor in nature’. Further research is required in order to determine the risk posed by unexploded ordnance. In lieu of further research, UXO risk mitigation measures including magnetometer scanning should be carried out for all intrusive works.

7 CIRIA C681 (2009) Unexploded *ordnance (UXO) A guide for the construction industry*

3.0 SCREENING

The Camden planning guidance suggests that any development proposal that includes a basement should be screened to determine whether or not a full BIA is required.

3.1 Screening Assessment

A number of screening tools are included in the Arup document and for the purposes of this report reference has been made to Appendices E1, E2 and E3 which include a series of questions within screening flowcharts for surface flow and flooding, subterranean (groundwater) flow and land stability. The flowchart questions and responses to these questions are tabulated below.

3.1.1 Subterranean (groundwater) Screening Assessment

Question	Response for 40 Ornan Road
1a. Is the site located directly above an aquifer?	No. The site is directly underlain by the London Clay, which is classified as an Unproductive stratum.
1b. Will the proposed basement extend beneath the water table surface?	No. The London Clay is classified as an unproductive stratum and cannot support a water table. However, if an upper weathered layer or head deposits are present, this may have a higher permeability and could have the potential to collect groundwater if the stratum has a predominantly granular matrix, which is unlikely in this setting.
2. Is the site within 100 m of a watercourse, well (used/ disused) or potential spring line?	No. A tributary of the River Tyburn previously flowed about 125 m to the east of the site. The Envirocheck report and Figure 11 of the Arup report confirm this.
3. Is the site within the catchment of the pond chains on Hampstead Heath?	No. Figure 14 of the Arup report confirms that the site is not located within this catchment area.
4. Will the proposed basement development result in a change in the proportion of hard surfaced / paved areas?	No. The proposed basement will extend beneath the existing building and will not therefore result in a significant change in the proportion of hard surfaced / paved areas.
5. As part of the site drainage, will more surface water (e.g. rainfall and run-off) than at present be discharged to the ground (e.g. via soakaways and/or SUDS)?	No. It is not considered feasible that the ground would be sufficiently permeable to allow for a soakaway discharge design, nor do the details of the proposed development indicate the use of soakaway drainage.
6. Is the lowest point of the proposed excavation (allowing for any drainage and foundation space under the basement floor) close to or lower than, the mean water level in any local pond or spring line?	No.

The above assessment has identified no potential issues that need to be assessed.

3.1.2 Stability Screening Assessment

Question	Response for 40 Ornan Road
1. Does the existing site include slopes, natural or manmade, greater than 7°?	No. The site is detached with low vertical retaining walls. However, the overall slope angle of the site is less than 7°.
2. Will the proposed re-profiling of landscaping at the site change slopes at the property boundary to more than 7°?	No. The site is not to be significantly re-profiled as part of the development.
3. Does the development neighbour land, including railway cuttings and the like, with a slope greater than 7°?	No. As indicated on the Slope Angle Map Fig 16 of the Arup report.
4. Is the site within a wider hillside setting in which the general slope is greater than 7°?	No. As indicated on the Slope Angle Map Fig 16 of the Arup report.

Question	Response for 40 Ornan Road
5. Is the London Clay the shallowest strata at the site?	*Yes. As indicated on the geological map and Figures 3, 5 and 8 of the Arup report*
6. Will any trees be felled as part of the proposed development and / or are any works proposed within any tree protection zones where trees are to be retained?	No. The proposed basement is not within any tree protection zone.
7. Is there a history of seasonal shrink-swell subsidence in the local area and / or evidence of such effects at the site?	*Yes. The area is prone to these effects as a result of the presence of shrinkable London Clay.*
8. Is the site within 100 m of a watercourse or potential spring line?	No. A tributary of the River Tyburn previously flowed about 125 m to the east of the site. The Envirocheck report and Figure 11 of the Arup report confirm this.
9. Is the site within an area of previously worked ground?	No. Not according to Figure 3 of the Arup report.
10a. Is the site within an aquifer?	No. The site is located above an unproductive stratum.
10b. Will the proposed basement extend beneath the water table such that dewatering may be required during construction?	No. The London Clay is classified as an unproductive stratum and cannot support a water table.
11. Is the site within 50 m of Hampstead Heath ponds?	No. Figure 14 of the Arup report confirms that the site is not located within this catchment area.
12. Is the site within 5 m of a highway or pedestrian right of way?	No. Whilst the site fronts onto Ornan Road, the proposed basement extension is set back at a distance greater than 5 m from the front of the site.
13. Will the proposed basement significantly increase the differential depth of foundations relative to neighbouring properties?	*Yes. It is likely that the development will increase the foundation depths relative to the neighbouring properties to a relatively significant extent.*
14. Is the site over (or within the exclusion zone of) any tunnels, e.g. railway lines?	No. Whilst London Overground tunnels are present 20 m to the north and south, the area of the proposed development is not understood to be located in an exclusion zone and is unlikely to have any adverse impact on these assets.

The above assessment has identified the following potential issues that need to be assessed:

Q5 The London Clay is the shallowest stratum at the site.
Q7 The site is in an area likely to be affected by seasonal shrink-swell.
Q13 The development may increase the foundation depths relative to the neighbouring properties to a relatively significant extent.

3.1.3 Surface Flow and Flooding Screening Assessment

Question	Response for 40 Ornan Road
1. Is the site within the catchment of the pond chains on Hampstead Heath?	No. Figure 14 of Arup report confirms that the site is not located within this catchment area.
2. As part of the proposed site drainage, will surface water flows (e.g. volume of rainfall and peak run-off) be materially changed from the existing route?	No. There will not be an increase in impermeable area across the site, so the surface water flow regime will be unchanged. The basement will entirely be beneath the footprint of the building, and the 1m distance between the roof of the basement and ground surface as recommended by section 3.2 of the CPG Basements 2018 does not apply.
3. Will the proposed basement development result in a change in the proportion of hard surfaced / paved areas?	No. There will not be a change in impermeable area across the ground surface above the basement.
4. Will the proposed basement development result in changes to the profile of the inflows (instantaneous and long term) of surface water being received by adjacent	No. There will not be an increase in impermeable area across the site, so the surface water flow regime will be unchanged. The basement will entirely be beneath the footprint of the

Question	Response for 40 Ornan Road
properties or downstream watercourses?	building, and the 1m distance between the roof of the basement and ground surface as recommended by section 3.2 of the CPG Basements 2018 does not apply.
5. Will the proposed basement result in changes to the quality of surface water being received by adjacent properties or downstream watercourses?	No. The proposed basement is very unlikely to result in any changes to the quality of surface water being received by adjacent properties or downstream watercourses as the surface water drainage regime will be unchanged and the land uses will remain the same.
6. Is the site in an area identified to have surface water flood risk according to either the Local Flood Risk Management Strategy or the Strategic Flood Risk Assessment or is it at risk of flooding, for example because the proposed basement is below the static water level of nearby surface water feature?	*Yes. The findings of this BIA together with the Camden Flood Risk Management Strategy dated 2013 and Figures 3v, 4e, 5a and 5b of the SFRA dated 2014, in addition to the Environment Agency online flood maps show that the site has a very low to low flooding risk from surface water. The flood depth during low risk events would be up to 0.30 m and 0.90 m around the building. There is a very low risk from sewers, and reservoirs (and other artificial sources), and fluvial / tidal watercourses. It is possible that the basement will be constructed within perched groundwater and the recommendations outlined in the BIA with regards to water-proofing and tanking of the basement will reduce the risk to acceptable levels. In accordance with paragraph 6.16 of the CPG a positive pumped device and non-return valve will be installed in the basement in order to further protect the site from sewer flooding.*

The above assessment has identified a single potential issue that need to be assessed:

Q6 The site has a very low to low flooding risk from surface water

4.0 SCOPING AND SITE INVESTIGATION

The purpose of scoping is to assess in more detail the factors to be investigated in the impact assessment. Potential impacts are assessed for each of the identified potential impact factors.

4.1 Potential Impacts

The following potential impacts have been identified by the screening process

Potential Impact	Consequence
London Clay is the shallowest stratum at the site.	The London Clay is prone to seasonal shrink-swell (subsidence and heave).
Seasonal shrink-swell can result in foundation movements.	Multiple potential impacts depending on the specific setting of the basement development. For example, in terraced properties, the implications of a deepened basement/foundation system on neighbouring properties should be considered.
The development will increase the differential founding depth	Should the design of retaining walls and foundations not take into account the configuration and bearing stratum of adjacent foundations, it may lead to the structural damage of associated structures.
The site has a very low to low flooding risk from surface water	It is possible that the basement will be constructed within perched groundwater

These potential impacts have been investigated through the site investigation, as detailed in Section 13.0.

4.2 Exploratory Work

The scope of the investigation was limited by the presence of the exiting house. In order to meet the objectives described in Section 1.2, as far as possible within the access restrictions, two boreholes were advanced to a depth of 6.50 m using an open drive percussive Terrier rig. Additionally, three boreholes were advanced using a drive-in window sampler, to a depth of 3.50 m.

During boring, disturbed and undisturbed samples were obtained from the boreholes for subsequent laboratory examination and testing. Standard Penetration Tests (SPTs) were carried out at regular intervals to provide additional quantitative data on the strength of soils encountered.

Groundwater monitoring standpipes were installed into three of the boreholes, to depths of 3.00 m and 5.00 m and have subsequently been monitored on a single occasion to date, approximately two weeks after installation. Two more monthly visits are scheduled.

A selection of disturbed and undisturbed samples recovered from the boreholes was submitted to a soil mechanics laboratory for a programme of geotechnical testing and an analytical laboratory for a programme of contamination testing.

All of the above work was carried out under the supervision of a geotechnical engineer from GEA.

The borehole records are appended, together with the results of the laboratory testing and a site plan indicating the borehole locations. The levels shown on the borehole records have been interpolated from spot heights on a Topographical Survey (Pre Application Advice, dated June 2019, provided by the architects), which were measured relative to a Temporary Benchmark (TBM).

4.3 Sampling Strategy

The boreholes and trial pits were positioned on site by an engineer from GEA in accessible areas, with due regard to the proposed development and the locations of known buried services.

Four samples of the shallow soil were subjected to analysis for a range of common industrial contaminants and contamination indicative parameters. For this investigation the analytical suite for the soil included a range of metals, total petroleum hydrocarbons (TPH), polycyclic aromatic hydrocarbons (PAH), total cyanide and monohydric phenols. The samples were also screened for asbestos. The contamination analyses were carried out at an MCERTs accredited laboratory with the majority of the testing suite accredited to MCERTS standards. A summary of the MCERTs accreditation and test methods are included with the attached results and further details are available upon request.

5.0 GROUND CONDITIONS

The investigation has confirmed the expected ground conditions in that, beneath a moderate thickness of made ground, London Clay was encountered and proved to the full depth of the investigation.

5.1 Made Ground

The made ground comprised dark brown slightly clayey gravelly sand with fragments of concrete and bricks and extended to depths of between 0.30 m (7.50 m TBM) and 1.20 m (6.60 m TBM).

No evidence of significant contamination was identified during the fieldwork. As a precaution, three samples of the made ground have been tested for the presence of contamination and the results are presented in Section 6.4.

5.2 London Clay

The London Clay comprised firm becoming stiff occasionally mottled bluish grey becoming greyish brown silty clay with selenite crystals to the full depth investigated, of 6.50 m (1.30 m TBM).

Laboratory plasticity index tests indicate this layer to be of high-volume change potential.

5.3 Groundwater

Groundwater was not encountered during the fieldwork.

The standpipes installed in Borehole Nos 1, 2 and 5 have been monitored on two occasions since installation, the results of which are shown in the table below.

Date	Borehole No	Depth to water (m) below existing garden level (m TBM)
15/10/2019	1	1.30 (6.50)
	2	5.45 (2.35)
	5	2.50 (5.97)

As groundwater was not encountered within the London Clay during drilling, the monitored water levels are considered likely to be a result of drainage from perched water within the overlying made ground collected into the standpipes. The variation in monitored water levels is not indicative of a continuous groundwater table within the London Clay beneath the site which is consistent with cohesive strata. This will however be reviewed on completion of the monitoring programme.

5.4 Soil Contamination

The table below sets out the values measured within three samples of made ground; all concentrations are in mg/kg unless otherwise stated.

Determinant	BH1 – 0.50 m	BH2 – 0.50 m	WS4 – 0.50 m	WS5 – 0.50 m
Asbestos	Not detected	Not detected	Not detected	Not detected

Determinant	BH1 – 0.50 m	BH2 – 0.50 m	WS4 – 0.50 m	WS5 – 0.50 m
pH	8.1	7.9	8.0	8.0
Arsenic	23	11	28	25
Cadmium	<0.2	<0.2	<0.2	<0.2
Chromium	**28**	**28**	**38**	**42**
Copper	37	32	80	89
Mercury	1.7	1.2	<0.3	<0.3

Benzo(a)pyrene	0.35	0.25	2.0	0.47
Total PAH	3.60	3.88	25.0	6.47
Total organic carbon %	1.1	1.3	1.9	1.3

Note: Figures in bold indicate values in excess of the generic guideline screening values.

The results of the contamination testing have revealed elevated concentrations of lead and chromium within all the samples of made ground tested. All other contaminants were found to be below their respective generic guideline value.

5.4.1 Generic Quantitative Risk Assessment

The use of a risk-based approach has been adopted to provide an initial screening of the test results to assess the need for subsequent site-specific risk assessments. To this end the table below indicates those contaminants of concern that have values in excess of a generic human health risk based guideline values which are either that of the CLEA[8] Soil Guideline Value where available, the Defra C4SLs or are a Generic Guideline Value calculated using the CLEA UK Version 1.07 software. For this development, the soil concentrations measured have been compared with values generated by the software assuming a residential end use with plant uptake to determine the relative sensitivity to the end use. The key generic assumptions for the proposed end use are as follows:

- that groundwater will not be a critical risk receptor;
- that the critical receptor for human health will be a young female aged 0 to 6 years old;

8 *Updated Technical Background to the CLEA Model (Science Report SC050021/SR3) Jan 2009* and Soil Guideline Value reports for specific contaminants; all DEFRA and Environment Agency.

- that the exposure duration will be six years;
- that the building type equates to a terraced house; and
- that the critical exposure pathways will be direct soil and indoor dust ingestion, consumption of homegrown produce, consumption of soil adhering to home grown produce, skin contact with soils and dust, and inhalation of dust and vapours.

It is considered that these assumptions are acceptable for this generic assessment of this site, with the exception of the groundwater risk, which will be discussed in Part 2. The tables of generic screening values derived by GEA and an explanation of how each value has been derived are included in the Appendix.

Where contaminant concentrations are measured at concentrations below the generic screening value it is considered that they pose an acceptable level of risk and thus further consideration of these contaminant concentrations is not required. Where concentrations are measured in excess of these generic screening values there is considered to be a potential that they could pose an unacceptable risk and thus further action will be required which could include;

- additional testing to zone the extent of the contaminated material and thus reduce the uncertainty with regard to its potential risk;
- site specific risk assessment to refine the assessment criteria and allow an assessment to be made as to whether the concentration present would pose an unacceptable risk at this site; or
- soil remediation or risk management to mitigate the risk posed by the contaminant to a degree that it poses an acceptable risk.

The results of the contamination testing have revealed elevated concentrations of lead and chromium within all the samples of made ground tested. The rest of the contaminants were found to be below their respective generic guideline value and of generally low concentrations.

This assessment is based upon the potential for risk to human health, which at this site is considered to be the critical risk receptor.

The results are discussed in detail in Section 2 of this report.

Part 2: DESIGN BASIS REPORT

This section of the report provides an interpretation of the findings detailed in Part 1, in the form of a ground model, and then provides advice and recommendations with respect to foundation options and contamination issues.

6.0 INTRODUCTION

It is understood that it is proposed to undertake a number of alterations including the construction of a single storey extension at the front and the rear. The proposals also include the excavation of a single storey basement at the front of the house. The basement levels are proposed to extend to approximately 3.00 m (4.80 m TBM) below existing ground floor level.

Anticipated line loads for the proposed basement walls are understood to be in the region of 25 kN/m to 65 kN/m, which will be applied to a basement raft following completion of the basement construction.

7.0 GROUND MODEL

The desk study research has indicated that the site has not had a potentially contaminative history, having had a residential use for its entire developed history. On the basis of the fieldwork, the ground conditions at this site can be characterised as follows:

- below a nominal thickness of made ground, London Clay is present to the full depth of the investigation;
- the made ground comprises dark brown slightly clayey gravelly sand with fragments of concrete and brick and extended to depths of between 0.30 m (7.50 m TBM) and 1.20 m (6.60 m TBM);
- the London Clay comprises firm becoming stiff occasionally mottled bluish grey becoming greyish brown silty clay with selenite crystals and selenite crystals to the full depth investigated, of 6.50 m (1.30 m TBM);
- groundwater was not encountered during the field work but subsequent monitoring measured groundwater at depths of between 1.30 m (6.50 m TBM) and 5.45 m (2.35 m TBM) and two subsequent monitoring visits are scheduled;
- the measured groundwater is considered to represent the presence of perched water within the made ground and not a general groundwater table; and
- the contamination testing has measured elevated concentration of lead and chromium within all the samples of made ground tested.

8.0 ADVICE AND RECOMMENDATIONS

Excavations for the proposed basement structure will require temporary support to maintain stability and to prevent any excessive ground movements. It should be feasible to construct the basement without the requirement for groundwater protection measures, although provision will need to be made to control perched water inflows from the base of the made ground.

Formation level for the proposed development is likely to be within London Clay, which should provide an eminently suitable bearing stratum for spread foundations excavated from basement level.

8.1 Basement Excavation

8.1.1 Basement Construction

It is understood that the proposed basement will extend to a depth of approximately 3.00 m (4.80 m TBM) below existing ground level, such that formation level is likely to be within the firm to stiff London Clay.

The investigation has indicated that groundwater is unlikely to be encountered within the London Clay. However, shallow inflows of perched water should be anticipated from within the made ground, particularly in the vicinity of existing structures and following periods of heavy rainfall. However, any such inflows are likely to be relatively minor in nature and should be adequately dealt with through sump pumping, although it would be prudent for the chosen contractor to have a contingency plan in place to deal with more significant or prolonged inflows as a precautionary measure.

There are a number of methods by which the sides of the basement excavation could be supported in the temporary and permanent conditions. The choice of wall will be governed, to a large extent, by whether it is to be incorporated into the permanent works and have a load bearing function. The final choice will depend on a number of factors, including the need to protect nearby structures from movements, the required overall stiffness of the support system and the potential need to control groundwater movement through the wall in the temporary condition. In this respect the stability of the adjacent buildings will be paramount.

It is understood that the preferred method of retaining wall construction is through traditional mass concrete underpinning of the existing walls, which will have the benefit of minimising the plant required and maximising usable space in the new basement construction.

Whilst the proposed construction is set back from the site boundaries and the foundations of the adjoining structures, careful workmanship will still be required to ensure that movement of the surrounding structures does not arise. The contractor should also be required to provide details of how they intend to control groundwater and instability of excavations, should it arise.

The ground movements associated with the basement excavation will depend on the method of excavation and support and the overall stiffness of the basement structure in the temporary condition. Thus, a suitable amount of propping will be required to provide the necessary rigidity. In this respect the timing of the provision of support to the wall will have an important effect on movements. The stability of the adjacent foundations will need to be ensured at all times and the existing foundations will need to be underpinned prior to construction of the proposed new basements or will need to be supported by new retaining walls. A Ground Movement Analysis has been carried out in accordance with the requirements of CPG and is presented in Part 3 below.

8.1.2 Retaining Walls

The following parameters are suggested for the design of the permanent basement retaining walls.

Stratum	Bulk Density (kg/m^3)	Effective Cohesion ($c' - kN/m^2$)	Effective Friction Angle (Φ' – degrees)
Made Ground	1700	Zero	27
London Clay	1950	Zero	24

Significant inflows of groundwater are unlikely to be encountered within the basement excavation, although monitoring of the standpipes should be continued to confirm this.

Consideration should, however, be given to the risk of surface water building up behind the retaining walls and unless adequate drainage can be incorporated to prevent such build-up, it is recommended that the basement is designed with a water level assumed to be 1.0 m below ground level.

Reference should be made to BS8102:2009[9] regarding requirements for waterproofing.

8.1.3 Basement Heave

The approximately 3.0 m (4.80 m TBM) deep excavations to form the proposed basements will result in a net unloading of up to approximately 50 kN/m^2.

This unloading will result in elastic heave and long term swelling of the underlying clay soils, although these movements will to a certain extent be counteracted by the applied loads from the proposed development.

Further consideration is given to heave movements in Part 3.0 of this report.

8.2 Shallow Foundations

It is understood that it is proposed to utilise a basement raft foundation, which provided that the loads can be relatively uniformly distributed, should a suitable solution as the total loads of the proposed development are understood to be close to the degree of unloading, such that the net bearing pressure change is likely to be very small.

Alternately, spread foundations, including underpinned foundations, bearing beneath basement formation level in the firm to stiff silty clay of the London Clay may be designed to apply a net allowable bearing pressure of 150 kN/m^2 at a depth of 3.00 m (4.80 m TBM). This value incorporates an adequate factor of safety against bearing capacity failure and should ensure that settlement remains within normal tolerable limits.

The depth of the basement excavation is expected to be such that foundations will be placed below the depth of actual or potential desiccation, but this should be checked once the proposals have been finalised, with the survey drawing showing former and existing trees. Notwithstanding NHBC guidelines, all foundations should extend beyond the zone of desiccation. In this respect, it would be prudent to have all foundation excavations inspected by a suitably experienced engineer. Due allowance should be made for future growth of existing / proposed trees. The requirement for compressible material alongside foundations should be determined by reference to the NHBC guidelines.

9 BS8102 (2009) *Code of practice for protection of below ground structures against water from the ground*

8.3 Basement Floor Slabs

Following the excavation of the single level basement, it is likely that the floor slab for the proposed basement will need to be suspended over a void or layer of compressible material to accommodate the anticipated heave unless the slab can be suitably reinforced to cope with these movements.

8.4 Shallow Excavations

On the basis of the borehole findings it is considered that shallow excavations for foundations and services that extend through the made ground should remain generally stable in the short term, although some instability may occur. Where personnel are required to enter excavations, a risk assessment should be carried out and temporary lateral support or battering of the excavation sides considered in order to comply with normal safety requirements.

Significant inflows of groundwater into shallow excavations are not generally anticipated, although seepages may be encountered from localised perched water tables within the made ground or underlying London Clay, particularly in the vicinity of existing foundations, although such inflows should be suitably controlled by sump pumping.

8.5 Effect of Sulphates

Chemical analyses carried out on selected samples for water soluble sulphate have been compared with of Table C2 of BRE Special Digest 1: SD1 Third Edition (2005) in order to determine the sulphate class and are summarised in the table below. The assessment has been based on static groundwater conditions and the guidelines contained in the above digest should be followed in the design of foundation concrete.

Stratum	No of samples	pH	SO_4 (mg/l)	Design Sulphate Class	ACEC Class
Made Ground	4	7.9 to 8.1	30 to 120	DS-1	AC-1s

8.6 Site Specific Risk Assessment

The desk study has indicated that the site has not had a contaminative history, having had a residential use throughout its developed history, in an area dominated by residential streets. However, the results of the contamination testing have identified elevated concentrations of lead and chromium within all of the samples of made ground tested, taken from the existing front and rear garden.

The exact source of the contamination is unknown. However, the made ground was noted as containing variable amounts of extraneous material, including ash, and it is therefore likely that a fragment of such material was present within the samples tested, accounting for the elevated concentration. Information on Urban Soil Chemistry provided from the BGS also indicates that background concentrations in the vicinity of the site are 617.70 mg/kg and 55.10 mg/kg for lead and chromium respectively, such that a significant proportion of the measured concentrations could be the result of residual airborne sources.

Lead compounds are relatively immobile and unlikely to be in a soluble form and are considered to be non-volatile or of a low volatility. The contamination does not therefore present a significant vapour risk or a significant risk of leaching and migration within any perched groundwater within the made ground. As the site is underlain by the London Clay, classified as Unproductive Strata, a risk to groundwater has not been identified.

8.6.1 End Users

End users will be effectively isolated from any potential contamination within the extent of the existing and proposed structures, such that, only in proposed garden areas could end users conceivably come into direct contact with the contaminated soils, although this pathway is already in existence.

At this stage it is recommended that a cover thickness of imported subsoil and topsoil of 600 mm in thickness should be specified for any areas of new landscaping in accordance with recommendations from BRE[10]. It is likely to be possible to reduce the final thickness of cover required, but this will need to be determined once final levels have been established and the concentrations of potential contaminants within the imported material and in the soils at formation level are known.

8.6.2 Protection of Site Workers

Site workers should be made aware of the potential contamination and a programme of working should be identified to protect workers handling any soil. The method of site working should be in accordance with guidelines set out by HSE[11] and CIRIA[12] and the requirements of the Local Authority Environmental Health Officer.

A watching brief should be maintained during the site works and if any suspicious soil is encountered, it should be inspected by a suitably qualified engineer and further testing carried out if required.

8.6.3 Protection of Buried Services

It is unlikely that services are at risk from the contamination noted in the made ground. However, details of any proposed protection measures for buried plastic services will in any case need to be approved by the EHO and the relevant service authority prior to the adoption of any scheme.

8.7 Waste Disposal

Under the European Waste Directive, waste is classified as being either Hazardous or Non-Hazardous and landfills receiving waste are classified as accepting hazardous or non-hazardous wastes or the non-hazardous sub-category of inert waste in accordance with the Waste Directive. Waste classification is a staged process and this investigation represents the preliminary sampling exercise of that process. Once the extent and location of the waste that is to be removed has been defined, further sampling and testing may be necessary. The results from this ground investigation should be used to help define the sampling plan for such further testing, which could include WAC leaching tests where the totals analysis indicates the soil to be a hazardous waste or inert waste from a contaminated site. It should however be noted that the Environment Agency guidance WM3[13] states that landfill WAC analysis, specifically leaching test results, must not be used for waste classification purposes.

Any spoil arising from excavations or landscaping works, which is not to be re-used in accordance with the CL:AIRE[14] guidance, will need to be disposed of to a licensed tip. Waste going to landfill is subject to landfill tax at either the standard rate of £91.35 per tonne (about £219 per m^3) or at the lower rate of £2.90 per tonne (roughly £6.95 per m^3). However, the

10 BRE (2004) Cover *systems for land regeneration. Thickness of cover systems for contaminated land.* BRE pub 465
11 HSE (1992) HS(G)66 *Protection of workers and the general public during the development of contaminated land* HMSO
12 CIRIA (1996) A *guide for safe working on contaminated sites* Report 132, Construction Industry Research and Information Association
13 Environment Agency 2015. *Guidance on the classification and assessment of waste.* Technical Guidance WM3 First Edition
14 CL:AIRE March 2011. *The Definition of Waste: Development Industry Code of Practice* Version 2

classifications for tax purposes and disposal purposes differ and currently all made ground and topsoil is taxable at the 'standard' rate and only naturally occurring soil and stones, which are accurately described as such in terms of the 2011 Order, would qualify for the 'lower rate' of landfill tax.

Based upon on the technical guidance provided by the EA it is considered likely that the soils encountered during this ground investigation, as represented by the chemical analyses carried out, would be generally classified as follows;

Soil Type	Waste Classification (Waste Code)	WAC Testing Required Prior to Landfill Disposal?	Current applicable rate of Landfill Tax
Made ground	Non-hazardous (17 05 04)	No	£91.35/tonne (Standard rate)
London Clay	Inert (17 05 04)	No	£2.90 / tonne (Reduced rate for uncontaminated naturally occurring rocks and soils)

Under the requirements of the European Waste Directive all waste needs to be pre-treated prior to disposal. The pre-treatment process must be physical, thermal, chemical or biological, including sorting. It must change the characteristics of the waste in order to reduce its volume, hazardous nature, facilitate handling or enhance recovery. The waste producer can carry out the treatment, but they will need to provide documentation to prove that this has been carried out. Alternatively, the treatment can be carried out by an approved contractor. The Environment Agency has issued a position paper[15] which states that in certain circumstances, segregation at source may be considered as pre-treatment and thus excavated material may not have to be treated prior to landfilling if the soils can be segregated onsite prior to excavation by sufficiently characterising the soils insitu prior to excavation.

The above opinion with regard to the classification of the excavated soils is provided for guidance only and should be confirmed by the receiving landfill once the soils to be discarded have been identified.

The local waste regulation department of the Environment Agency (EA) should be contacted to obtain details of tips that are licensed to accept the soil represented by the test results. The tips will be able to provide costs for disposing of this material but may require further testing.

Part 3: GROUND MOVEMENT ANALYSIS

This section of the report comprises an analysis of the ground movements arising from the proposed basement and foundation scheme discussed in Part 2 and the information obtained from the investigation, presented in Part 1 of the report.

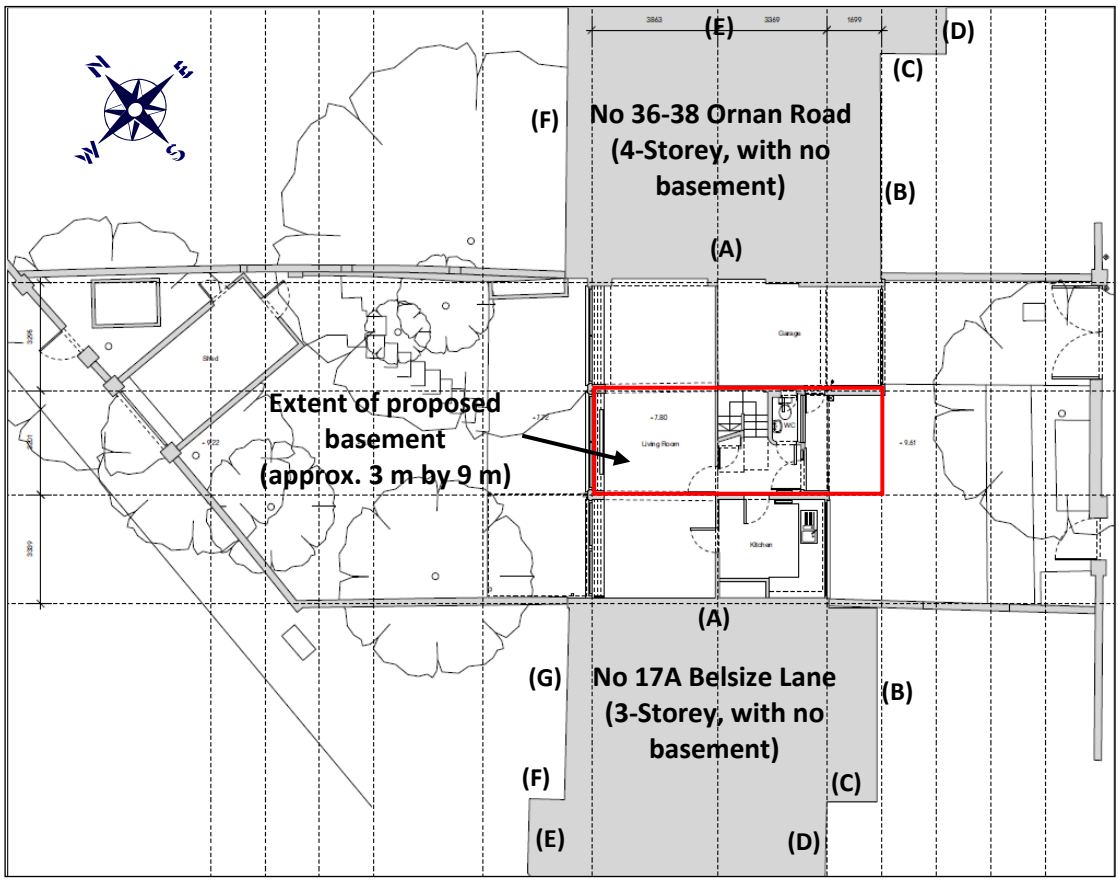
9.0 INTRODUCTION

The sides of an excavation will move to some extent regardless of how they are supported. The movement will typically be both horizontal and vertical and will be influenced by the engineering properties of the ground, groundwater level and flow, the efficiency of the various support systems employed during underpinning and the efficiency or stiffness of any support structures used.

An analysis has been carried out of the likely movements arising from the proposed excavation and the results of this analysis have been used to predict the effect of these movements on surrounding structures.

9.1 Basis of Ground Movement Assessment

A plan showing the nearby sensitive structures is shown below.



Sensitive structures relevant to this assessment include Nos 38-38 Ornan Road and No 17A Belsize Lane, to the northeast and southwest respectively.

The nature of the foundations of the adjoining structures is not known and a cautious approach has therefore been adopted with the assumption that the buildings are supported on relatively shallow spread foundations at a depth of 1.00 m (4.80 m TBM).

9.2 Construction Sequence

Consideration is being given to the redevelopment of the existing building to include a single level basement and it is understood that it is currently intended that the retaining walls will be constructed by means of traditional underpinning.

The following sequence of operations has been derived to enable analysis of the ground movements around the basement, both during and after construction, and is based on the proposed plans and sections provided by the consulting engineer, copies of which are included in the appendix.

Essentially the sequence may be considered as two groups of activities, the first comprising the short-term temporary works, whilst the second represents the construction of the permanent works.

In general, the sequence of works for excavation and construction, will comprise the following stages;

1. install concrete retaining walls to form section of new basement walls;

2. excavate ground to basement level with props installed mid height;

3. construct basement floor raft slab to connect with the underpinned foundations; and

4. construct ground floor slab to complete the basement ‘box’ and remove temporary propping.

The detail of the support provided to adjacent walls is beyond the scope of this report and the structural engineer will be best placed to agree the methodology with the chosen contractor(s) once appointed.

10.0 GROUND MOVEMENTS

The assessment of ground movements within the basement and associated with the excavation and raft mobilisation has been undertaken using the P-Disp (Version 20.0 – Build 12) package licensed from the OASYS suite of geotechnical modelling software from Arup. The X-Disp (Version 20.1 – Build 4) modelling software has been used to predict ground movements surrounding the basement that are likely to arise from the installation of the underpins and subsequent excavation of the proposed basement. The ground movements include settlement of the ground (vertical) and lateral movement of the soil (horizontal) behind the proposed retaining walls.

Both the P-Disp and X-Disp programs are commonly used within the ground engineering industry and are considered to be appropriate tools for the purpose of this analysis.

For the purpose of these analyses, the corners have been defined by x and y coordinates, with the x-direction parallel with the site boundaries, whilst the y-direction is parallel with Ornan Road. Vertical movement is in the z-direction.

The full outputs of all the analyses are included within the appendix.

10.1 Ground Movements – Surrounding the Basement

10.1.1 Model Used

For the X-Disp analysis, the installation curves for the panel-like planar diaphragm wall have been adopted as most appropriate for construction of the proposed underpinning.

The excavation phase has not, however, been modelled in this part of the assessment, as following dry-packing, the underpins will subject to vertical loading from the structure above, which will also act as additional support at ground level, and will be fully propped on exposure, until the basement raft and ground floor slabs are cast, such that potential deflections during the excavation phase are considered to be negligible.

The potential movements resulting from bulk excavation are more appropriately estimated in terms of the stress relief that will occur due to the removal of soil and transfer of existing / proposed loads to the underpins and proposed raft foundation and in this respect, the behaviour of the underpins under vertical loading and when connected to the basement raft, is considered in Section 10.2 below.

10.1.2 Results

The predicted movements are summarised in the table below; the results are presented below and in subsequent tables to the degree of accuracy required to allow predicted variations in ground movements around the structure to be illustrated but may not reflect the anticipated accuracy of the predictions.

Phase of Works	Maximum Wall Movement (mm)	
	Vertical Settlement	Horizontal Movement
Underpin Installation	1.50	1.50

The analysis has predicted that the maximum vertical and horizontal displacement that will result from the installation of the piled retaining wall is around 1.50 mm.

10.2 Ground Movements – Resulting from Excavation

10.2.1 Model Used

Unloading of the underlying soils, particularly the clay soils of the London Clay, will take place as a result of the excavation of the proposed basements and the reduction in vertical stress will cause heave to take place. Undrained soil parameters have been used to estimate the potential short-term movements, which include the “immediate” or elastic movements as a result of the basement excavation. Drained parameters have been used to provide an estimate of the total long-term movement.

The elastic analysis requires values of soil stiffness at various levels to calculate displacements. Values of stiffness for the soils at this site are readily available from published data and we have used a well-established method to provide our estimates. This relates values of E_u and E', the undrained and drained stiffness respectively, to values of undrained cohesion (Cu), as described by Padfield and Sharrock[16] and Butler[17] and more recently by O’Brien and

16 Padfield CJ and Sharrock MJ (1983) *Settlement of structures on clay soils.* CIRIA Special Publication 27
17 Butler FG (1974) *Heavily overconsolidated clays: a state of the art review.* Proc Conf Settlement of Structures, Cambridge, 531-578, Pentech Press, Lond

Sharp[18]. Relationships of E_u = 500 C_u and E' = 300 C_u for the cohesive soils have previously been used to obtain values of Young's modulus. More recent published data[19] indicates stiffness values of 750 x Cu for the London Clay and a ratio of E' to Cu of 0.75, and it is considered appropriate to use these values for this assessment where the basements bear into the London Clay.

The soil parameters used in this analysis are tabulated below.

Stratum	Depth Range (m) (m TBM)	Cohesion (KPa)	Eu (KPa)	E'(KPa)
Made Ground	GL to 3.0 (7.8 to 4.8)	20	15,000	11,250
London Clay	3.0 to 6.0 4.8 to 1.8)	45 to 85	33,750 to 63,750	25,313 to 47,813
	6.0 to 25.0 (1.8 to -17.2)	85 to 250	63,750 to 187,500	47,813 to 140,625

A rigid boundary for the analysis has been set at the base of the London Clay at a depth of 25.0 m below ground level. An increase in cohesion of 8 kN/m^2 for each metre of depth has been adopted to provide a conservative estimate of the likely strength profile within the London Clay below the maximum depth investigated.

The excavation of approximately 3.0 m thickness of soil for the proposed basement will result in a net unloading of 50 kN/m^2.

Information provided by the consulting engineer indicates that the loads on the proposed underpinning will result in a bearing pressure of between 215 kN/m^2 and 85 kN/m^2 in the short-term during construction. However, following completion of the basement 'box' and distribution of the proposed loads across the proposed raft, the average bearing pressure over the footprint of the entire basement will reduce to about 55 kN/m^2.

An assessment of the potential behaviour of these foundations has been included within the analysis, with a staged approach to the modelling adopted to reflect the change in the way the loads are applied during the course of construction.

10.2.2 Results

The predicted movements are summarised in the table below; the results are presented below and in subsequent tables to the degree of accuracy required to allow predicted variations in ground movements around the structure(s) to be illustrated, but may not reflect the anticipated accuracy of the predictions.

Location	Movements (mm) Heave is -ve and Settlement +ve)			
	Short-term (Post excavation Phase)			Total (post construction)
	Stage 1	Stage 2	Stage 3	Stage 4

18 O'Brien AS and Sharp P (2001) *Settlement and heave of overconsolidated clays - a simplified non-linear method.* Part Two, Ground Engineering, Nov 2001, 48-53

19 Burland JB, Standing, JR, and Jardine, FM (2001) Building response to tunnelling, case studies from construction of the Jubilee Line Extension. CIRIA Special Publication 200

Centre of proposed basement	1.0 to 1.5	-0.5 to -1.0	0.5 to 0.6	0.75 to 1.0
Edge of proposed basement / Underpinning	1.5 to 2.0	0.5 to 1.0	0.5 to 0.7	0.75 to 1.25
At 5 m from proposed basement	0 to 0.5	0 to 0.5	0 to 0.1	0 to 0.25

e 1 = Wall Installation; Stage 2 = Wall installation & bulk excavation; Stage 3 = Completion of basement box and application of raft loading; Stage 4 = Total movements following completion of development.

The P-Disp analysis indicates that, following wall installation, up to 2 mm of settlement is predicted on the proposed underpinning, which following excavation of the proposed basement is expected to reduce by about 1 mm due to the effect of unloading, with up to 1 mm of heave likely to occur at the centre of the proposed excavations.

Following completion of the basement construction and the distribution of the loads across the proposed basement raft, this short-term heave is likely to be recovered, with total settlement in the region of 1 mm.

11.0 DAMAGE ASSESSMENT

In addition to the above assessment of the likely movements that will result from the proposed development, any neighbouring buildings within the zone of influence of the excavations are considered to be sensitive structures, requiring Building Damage Assessments, on the basis of the classification given in Table 6.4 of CIRIA report C760[20].

The sensitive structure of No 36-38 Ornan Road and No 17A Belsize Lane have been modelled as a series of displacement lines in the analysis along which the damage assessment has been undertaken.

For the analyses, a foundation depth of approximately 1.0 m below existing ground level has been assumed.

11.1 Damage to Neighbouring Structures

The ground movements calculated using the P-Disp modelling software have been imported into X-Disp to carry out an assessment of the likely damage to adjacent properties, whereby the vertical heave and settlement movements along each sensitive structure have been used to estimate the deflection ratio of the nearby sensitive structures.

The building damage reports for sensitive structures highlighted above are included in the appendix and indicate that the damage to the adjoining and nearby structures due to short and total movements for each stage of the proposed development do not exceed Category 0 (negligible).

11.2 Monitoring of Ground Movements

The predictions of ground movement based on the ground movement analysis should be checked by monitoring of the adjacent properties and structures. The structures to be monitored during the construction stages should include the existing property and the neighbouring structure assessed above.

20 Gaba, A, Hardy, S, Powrie, W, Doughty, L and Selemetas, D (2017) Embedded *retaining walls – guidance for economic design CIRIA* Report C760

The precise monitoring strategy will be developed at a later stage and it will be subject to discussions and agreements with the owners of the adjacent properties and structures. Contingency measures will be implemented if movements of the adjacent structures exceed predefined trigger levels. Both contingency measures and trigger levels will need to be developed within a future monitoring specification for the works.

12.0 GMA CONCLUSIONS

The ground movement analysis has concluded that the predicted damage to the neighbouring properties would generally be 'Negligible'.

On this basis, the damage that has been predicted to occur as a result of the construction the proposed basement falls within the limits acceptable to the London Borough of Camden assuming that the careful control is taken during construction of the proposed excavations to ensure that no excessive movements occur that would lead to damage in excess of these limits.

Whilst it is recommended that movement monitoring is carried out on all structures prior to and during the proposed excavation and construction, it is unlikely that specification of these works will be required as part of the planning conditions but may be required in order to satisfy party wall awards.

Part 4: BASEMENT IMPACT ASSESSMENT

This section of the report evaluates the direct and indirect implications of the proposed project, based on the findings of the previous screening and scoping, site investigation and ground movement assessment.

13.0 INTRODUCTION

The screening identified a number of potential impacts. The desk study and ground investigation information has been used below to review the potential impacts, to assess the likelihood of them occurring and the scope for reasonable engineering mitigation.

13.1 Potential Impacts

The table below summarises the previously identified potential impacts and the additional information that is now available from the ground investigation in consideration of each impact.

Potential Impact	Site Investigation Conclusions
London Clay is the shallowest stratum at the site.	The London Clay is prone to seasonal shrink-swell (subsidence and heave).
Seasonal shrink-swell can result in foundation movements.	The London Clay is prone to seasonal shrink-swell and can cause structural damage. Desiccation was noted during the fieldwork in the vicinity of one of the trees to the front of the house.
The development will increase the differential founding depth	The adjoining properties are not understood to include existing basements, such that the proposed basement is likely to extend below the depth of the existing foundations. However, the results of the ground movement analysis (Part 3.0) indicate that any building damage is unlikely to exceed Category 0 (Negligible).
The site has a very low to low flooding risk from surface water	It is possible that the basement will be constructed within perched groundwater

The results of the site investigation have therefore been used below to review the remaining potential impacts, to assess the likelihood of them occurring and the scope for reasonable engineering mitigation.

London Clay is the shallowest stratum / Seasonal Shrink-Swell

The proposed basement will extend to a depth such that new foundations will be expected to bypass any desiccated soils.

Subject to inspection of foundation excavations in the normal way to ensure that there is not significant unexpectedly deep root growth, it is not considered that the occurrence of shrink-swell issues in the local area has any bearing on the proposed development.

The proposed basement will increase the differential depth of foundations relative to neighbouring properties

It is assumed that the proposed basement will extend to a significant depth relative to the existing foundations of the neighbouring properties and will need to be designed to ensure the stability of the site and any potentially sensitive structures that are in close proximity to the site.

An analysis of the potential ground movements resulting from construction of the proposed basement in included in Part 3 of this report and has concluded that the predicted damage to the neighbouring properties would be Category 0 (Negligible). On this basis, the damage that would inevitably occur as a result of such an excavation would fall well within the acceptable limits.

The site has a very low to low flooding potential from surface water

There is a very low risk from sewers, and reservoirs (and other artificial sources), and fluvial / tidal watercourses. It is possible that the basement will be constructed within perched groundwater and the recommendations outlined in the BIA with regards to water-proofing and tanking of the basement will reduce the risk to acceptable levels. In accordance with paragraph 6.16 of the CPG a positive pumped device and non-return valve will be installed in the basement in order to further protect the site from sewer flooding

13.2 BIA Conclusion

A Basement Impact Assessment has been carried out following the information and guidance published by the London Borough of Camden.

It is concluded that the proposed development is unlikely to result in any specific land or slope stability issues.

13.3 Non-Technical Summary of Evidence

This section provides a short summary of the evidence acquired and used to form the conclusions made within the BIA.

13.3.1 Screening

The following table provides the evidence used to answer the surface water flow and flooding screening questions.

Question	Evidence
1. Is the site within the catchment of the pond chains on Hampstead Heath?	Topographical maps acquired as part of the desk study and Figures 12, 13 and 14 of the Arup report.
2. As part of the proposed site drainage, will surface water flows (e.g. volume of rainfall and peak run-off) be materially changed from the existing route?	Existing plans of the site have confirmed that the proposed basement scheme will not increase the amount of hardstanding.
3. Will the proposed basement development result in a change in the proportion of hard surfaced / paved areas?	
4. Will the proposed basement development result in changes to the profile of the inflows (instantaneous and long term) of surface water being received by adjacent properties or downstream watercourses?	As above.
5. Will the proposed basement result in changes to the quantity of surface water being received by adjacent properties or downstream watercourses?	
6. Is the site in an area known to be at risk from surface water flooding such as South Hampstead, West Hampstead, Gospel Oak and Kings Cross, or is it at risk of flooding because the proposed basement is below the static water level of a nearby surface water feature?	Flood risk maps acquired from the Environment Agency as part of the desk study, Figure 15 of the Arup report, the Camden Flood Risk Management Strategy dated 2013 and SFRA dated 2014.

The following table provides the evidence used to answer the subterranean (groundwater flow) screening questions.

Question	Evidence
1a. Is the site located directly above an aquifer?	Aquifer designation maps acquired from the Environment Agency as part of the desk study and Figures 3 and 8 of the Arup report.
1b. Will the proposed basement extend beneath the water table surface?	Previous nearby GEA investigations and BGS archive borehole records.
2. Is the site within 100 m of a watercourse, well (used/ disused) or potential spring line?	Historical maps acquired as part of the desk study, Figures 11 and 12 of the Arup report and the Lost Rivers of London book.
3. Is the site within the catchment of the pond chains on Hampstead Heath?	Figures 12, 13 and 14 of the Arup report.
4. Will the proposed basement development result in a change in the proportion of hard surfaced / paved areas?	Existing plans of the site have confirmed that the basement development will only replace existing hardstanding areas.
5. As part of the site drainage, will more surface water (e.g. rainfall and run-off) than at present be discharged to the ground (e.g. via soakaways and/or SUDS)?	The details of the proposed development do not indicate the use soakaway drainage.
6. Is the lowest point of the proposed excavation (allowing for any drainage and foundation space under the basement floor) close to or lower than, the mean water level in any local pond or spring line?	Figures 11 and 12 of the Arup report.

The following table provides the evidence used to answer the slope stability screening questions.

Question	Evidence
1. Does the existing site include slopes, natural or manmade, greater than 7°?	Figures 16 and 17 of the Arup report.
2. Will the proposed re-profiling of landscaping at the site change slopes at the property boundary to more than 7°?	The details of the proposed development provided do not include the re-profiling of the site to create new slopes.
3. Does the development neighbour land, including railway cuttings and the like, with a slope greater than 7°?	Figures 16 and 17 of the Arup report.
4. Is the site within a wider hillside setting in which the general slope is greater than 7°?	
5. Is the London Clay the shallowest strata at the site?	Geological maps and Figures 3 and 8 of the Arup report.
6. Will any trees be felled as part of the proposed development and / or are any works proposed within any tree protection zones where trees are to be retained?	Site plans and confirmation during the site work.
7. Is there a history of seasonal shrink-swell subsidence in the local area and / or evidence of such effects at the site?	Knowledge on the ground conditions of the area and reference to NHBC guidelines were used to make an assessment of this, in addition to a visual inspection of the buildings carried out during the site walkover.
8. Is the site within 100 m of a watercourse or potential spring line?	Figures 11 and 12 of the Arup report and the Lost Rivers of London book.
9. Is the site within an area of previously worked ground?	Geological maps and Figures 3 and 8 of the Arup report.
10. Is the site within an aquifer?	Aquifer designation maps acquired from the Environment Agency as part of the desk study and Figures 3 and 8 of the Arup report.

Question	Evidence
11. Is the site within 50 m of Hampstead Heath ponds?	Figures 12, 13 and 14 of the Arup report.
12. Is the site within 5 m of a highway or pedestrian right of way?	Site plans
13. Will the proposed basement significantly increase the differential depth of foundations relative to neighbouring properties?	Camden planning portal confirmed the position of the proposed basement relative the neighbouring properties.
14. Is the site over (or within the exclusion zone of) any tunnels, e.g. railway lines?	Maps and plans of infrastructure tunnels were reviewed.

13.3.2 Scoping and Site Investigation

The questions in the screening stage that there were answered 'yes', were taken forward to a scoping stage and the potential impacts discussed in Section 4.0 of this report, with reference to the possible impacts outlined in the Arup report.

A ground investigation has been carried out, which has allowed an assessment of the potential impacts of the basement development on the various receptors identified from the screening and scoping stages. Principally the investigation aimed to establish the ground conditions, including the groundwater level and the engineering properties of the underlying soils to enable suitable design of the basement development.

The findings of the investigation are discussed in Part 2 of this report and summarised in the Executive Summary.

13.3.3 Impact Assessment

Section 14.0 of this report summarises whether, on the basis of the findings of the investigation, the potential impacts still need to be given consideration and identifies ongoing risks that will require suitable engineering mitigation. Section 9.0 of this report also provides recommendations for the design of the proposed development.

A ground movement analysis and building damage assessment has been carried out and its findings are presented in Part 3.

14.0 OUTSTANDING RISKS AND ISSUES

This section of the report aims to highlight areas where further work is required as a result of limitations on the scope of this investigation, or where issues have been identified by this investigation that warrant further consideration. The scope of risks and issues discussed in this section is by no means exhaustive but covers the main areas where additional work may be required.

The ground is a heterogeneous natural material and variations will inevitably arise between the locations at which it is investigated. This report provides an assessment of the ground conditions based on the discrete points at which the ground was sampled, but the ground conditions should be subject to review as the work proceeds to ensure that any variations from the Ground Model are properly assessed by a suitably qualified person.

As discussed throughout the report, perched water is likely to be encountered during the basement excavation, although the finding of the investigation indicate that potential inflows are unlikely to be significant and should be adequately dealt with through sump pumping. However, groundwater monitoring should be continued, and trial excavations should be

considered to assess the extent of inflows to be expected within the proposed basement excavations.

The investigation has not identified the presence of any significant contamination and as the some of the made ground will be removed from this site through the excavation of the proposed basement and large areas are covered by hardstanding, remedial measures should not be required, other than where areas of soft landscaping are to be formed. However, as with any site there is a potential for further areas of contamination to be present within the made ground beneath parts of the site not covered by the investigation it is recommended that a watching brief is maintained during any groundworks for the proposed new foundations and that if any suspicious soils are encountered that they are inspected by a geoenvironmental engineer and further assessment may be required.

The findings of the ground movement analysis and damage assessment should be reviewed once the design proposals have been finalised, particularly if any changes are made to the proposed basement construction.

These items should be drawn to the attention of prospective contractors and further investigation will be required or sufficient contingency should be provided to cover the outstanding risk.

Samples Analysed:	4 soil samples		

Signed:

Zina Abdul Razzak
Senior Quality Specialist
For & on behalf of i2 Analytical Ltd.

Standard Geotechnical, Asbestos and Chemical Testing Laboratory located at: ul. Pionierów 39, 41 -711 Ruda Śląska, Poland.

Accredited tests are defined within the report, opinions and interpretations expressed herein are outside the scope of accreditation.

Standard sample disposal times, unless otherwise agreed with the laboratory, are :

soils	- 4 weeks from reporting
leachates	- 2 weeks from reporting
waters	- 2 weeks from reporting
asbestos	- 6 months from reporting

Excel copies of reports are only valid when accompanied by this PDF certificate.

Any assessments of compliance with specifications are based on actual analytical results with no contribution from uncertainty of measurement. Application of uncertainty of measurement would provide a range within which the true result lies. An estimate of measurement uncertainty can be provided on request.

Project / Site name: 40 Ornan Road, London, NW3 4QB

* These descriptions are only intended to act as a cross check if sample identities are questioned. The major constituent of the sample is intended to act with respect to MCERTS validation. The laboratory is accredited for sand, clay and loam (MCERTS) soil types. Data for unaccredited types of solid should be interpreted with care.

Stone content of a sample is calculated as the % weight of the stones not passing a 10 mm sieve. Results are not corrected for stone content.

Lab Sample Number	Sample Reference	Sample Number	Depth (m)	Sample Description *
17470	WS1	None Supplied	0.50	Brown clay and sand.
17471	WS2	None Supplied	0.50	Brown clay.
17472	WS4	None Supplied	0.50	Brown loam and clay with gravel and glass.
17473	WS5	None Supplied	0.50	Brown clay and sand with vegetation.

Analytical Report Number : 19-63190

Project / Site name: 40 Ornan Road, London, NW3 4QB

Water matrix abbreviations: Surface Water (SW) Potable Water (PW) Ground Water (GW) Process Water (PrW)

Analytical Test Name	Analytical Method Description	Analytical Method Reference	Method number	Wet / Dry Analysis	Accreditation Status
Asbestos identification in soil	Asbestos Identification with the use of polarised light microscopy in conjunction with disperion staining techniques.	In house method based on HSG 248	A001-PL	D	ISO 17025
Chloride, water soluble, in soil	Determination of Chloride colorimetrically by discrete analyser.	In-house method based on BS1377 Part 3, 1990, Chemical and Electrochemical Tests. 2:1 extraction.	L082-PL	D	MCERTS
Hexavalent chromium in soil	Determination of hexavalent chromium in soil by extraction in water then by acidification, addition of 1,5 diphenylcarbazide followed by colorimetry.	In-house method	L080-PL	W	MCERTS
Metals in soil by ICP-OES	Determination of metals in soil by aqua-regia digestion followed by ICP-OES.	In-house method based on MEWAM 2006 Methods for the Determination of Metals in Soil.	L038-PL	D	MCERTS
Moisture Content	Moisture content, determined gravimetrically.	In-house method based on BS1377 Part 2, 1990, Chemical and Electrochemical Tests	L019-UK/PL	W	NONE
Monohydric phenols in soil	Determination of phenols in soil by extraction with sodium hydroxide followed by distillation followed by colorimetry.	In-house method based on Examination of Water and Wastewater 20th Edition: Clesceri, Greenberg & Eaton (skalar)	L080-PL	W	MCERTS
pH in soil (automated)	Determination of pH in soil by addition of water followed by automated electrometric measurement.	In-house method based on BS1377 Part 3, 1990, Chemical and Electrochemical Tests	L099-PL	D	MCERTS
Speciated EPA-16 PAHs in soil	Determination of PAH compounds in soil by extraction in dichloromethane and hexane followed by GC-MS with the use of surrogate and internal standards.	In-house method based on USEPA 8270	L064-PL	D	MCERTS
Stones content of soil	Standard preparation for all samples unless otherwise detailed. Gravimetric determination of stone > 10 mm as % dry weight.	In-house method based on British Standard Methods and MCERTS requirements.	L019-UK/PL	D	NONE
Sulphate, water soluble, in soil (16hr extraction)	Determination of water soluble sulphate by ICP-OES. Results reported directly (leachate equivalent) and corrected for extraction ratio (soil equivalent).	In-house method based on BS1377 Part 3, 1990, Chemical and Electrochemical Tests, 2:1 water:soil extraction, analysis by ICP-OES.	L038-PL	D	MCERTS
Sulphide in soil	Determination of sulphide in soil by acidification and heating to liberate hydrogen sulphide, trapped in an alkaline solution then assayed by ion selective electrode.	In-house method	L010-PL	D	MCERTS
Total cyanide in soil	Determination of total cyanide by distillation followed by colorimetry.	In-house method based on Examination of Water and Wastewater 20th Edition: Clesceri, Greenberg & Eaton (Skalar)	L080-PL	W	MCERTS
Total organic carbon (Automated) in soil	Determination of organic matter in soil by oxidising with potassium dichromate followed by titration with iron (II) sulphate.	In-house method based on BS1377 Part 3, 1990, Chemical and Electrochemical Tests""	L009-PL	D	MCERTS
Total sulphate (as SO4 in soil)	Determination of total sulphate in soil by extraction with 10% HCl followed by ICP-OES.	In-house method based on BS1377 Part 3, 1990, Chemical and Electrochemical Tests	L038-PL	D	MCERTS
TPH Banding in Soil by FID	Determination of hexane extractable hydrocarbons in soil by GC-FID.	In-house method, TPH with carbon banding.	L076-PL	W	MCERTS
TPH in (Soil)	Determination of TPH bands by HS-GC-MS/GC-FID	In-house method, TPH with carbon banding.	L076-PL	D	MCERTS

For method numbers ending in 'UK' analysis have been carried out in our laboratory in the United Kingdom.
For method numbers ending in 'PL' analysis have been carried out in our laboratory in Poland.
Soil analytical results are expressed on a dry weight basis. Where analysis is carried out on as-received the results obtained are multiplied by a moisture correction factor that is determined gravimetrically using the moisture content which is carried out at a maximum of 30oC.

tetrachloromethane (Carbon tetra	0.056	S4UL
trichloromethane (Chloroform)	1.7	S4UL

Notes

Concentrations measured below these screening values may be considered to represent 'uncontaminated conditions' which pose a 'LOW' risk to human health. Concentrations measured in excess of these values indicate a potential risk which require further, site specific risk assessment.

C4SL - Defra Category 4 Screening value based on Low Level of Toxicological Risk

SGV - Soil Guideline Value, derived from the CLEA model and published by Environment Agency 2009 - where not superseded by C4SL

S4UL - LQM/CIEH Suitable for use Level (2015) based on 'minimal' level of risk

Calc1 - sum of thresholds for Ali & Aro fractions - assuming a 35% Aro:65% Ali ratio as is commonly encountered in the soil

Calc2 - sum of nearest available carbon range specified including BTEX for PRO fraction

Total PAH based on B(a)P / 0.15 - GEA experience indicates that Benzo(a) pyrene rarely exceeds 15% of the total PAH concentration

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination.
For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client.
In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Report Version v53.0

Data Type	Page Number	On Site	0 to 250m	251 to 500m	501 to 1000m (*up to 2000m)
Agency & Hydrological					
BGS Groundwater Flooding Susceptibility	pg 1		Yes		n/a
Contaminated Land Register Entries and Notices					
Discharge Consents					
Prosecutions Relating to Controlled Waters			n/a	n/a	n/a
Enforcement and Prohibition Notices					
Integrated Pollution Controls					
Integrated Pollution Prevention And Control					
Local Authority Integrated Pollution Prevention And Control					
Local Authority Pollution Prevention and Controls	pg 1		2	3	12
Local Authority Pollution Prevention and Control Enforcements					
Nearest Surface Water Feature	pg 3				Yes
Pollution Incidents to Controlled Waters					
Prosecutions Relating to Authorised Processes					
Registered Radioactive Substances	pg 3			39	1
River Quality					
River Quality Biology Sampling Points					
River Quality Chemistry Sampling Points					
Substantiated Pollution Incident Register	pg 9				1
Water Abstractions	pg 10				4 (*14)
Water Industry Act Referrals					
Groundwater Vulnerability Map	pg 14	Yes	n/a	n/a	n/a
Groundwater Vulnerability - Soluble Rock Risk			n/a	n/a	n/a
Groundwater Vulnerability - Local Information			n/a	n/a	n/a
Bedrock Aquifer Designations	pg 14	Yes	n/a	n/a	n/a
Superficial Aquifer Designations			n/a	n/a	n/a
Source Protection Zones	pg 15			1	
Extreme Flooding from Rivers or Sea without Defences				n/a	n/a
Flooding from Rivers or Sea without Defences				n/a	n/a
Areas Benefiting from Flood Defences				n/a	n/a
Flood Water Storage Areas				n/a	n/a
Flood Defences				n/a	n/a
OS Water Network Lines	pg 15		1		6

Data Type	Page Number	On Site	0 to 250m	251 to 500m	501 to 1000m (*up to 2000m)
Waste					
BGS Recorded Landfill Sites					
Historical Landfill Sites	pg 16				1
Integrated Pollution Control Registered Waste Sites					
Licensed Waste Management Facilities (Landfill Boundaries)					
Licensed Waste Management Facilities (Locations)					
Local Authority Landfill Coverage	pg 16	1	n/a	n/a	n/a
Local Authority Recorded Landfill Sites					
Potentially Infilled Land (Non-Water)	pg 16			5	1
Potentially Infilled Land (Water)	pg 16				2
Registered Landfill Sites					
Registered Waste Transfer Sites	pg 17				2
Registered Waste Treatment or Disposal Sites					
Hazardous Substances					
Control of Major Accident Hazards Sites (COMAH)					
Explosive Sites					
Notification of Installations Handling Hazardous Substances (NIHHS)					
Planning Hazardous Substance Consents					
Planning Hazardous Substance Enforcements

GEA

London

Published 1871 - 1879

Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840`s. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Historical Aerial Photography

Published 1946

Source map scale - 1:1,250

The Historical Aerial Photos were produced by the Ordnance Survey at a scale of 1:1,250 and 1:10,560 from Air Force photography. They were produced between 1944 and 1951 as an interim measure, pending preparation of conventional mapping, due to post war resource shortages. New security measures in the 1950's meant that every photograph was re-checked for potentially unsafe information with security sites replaced by fake fields or clouds. The original editions were withdrawn and only later made available after a period of fifty years although due to the accuracy of the editing, without viewing both revisions it is not easy to spot the edits. Where available Landmark have included both revisions.
