

ENGINEERS' CONSTRUCTION NOTES

GENERAL

To be read in conjunction with all Engineer's drawings and notes. All work shall be carried out in accordance with the recommendations of the relevant Building Regulations and the Code of Practice for the construction of the building. The structural designs shown are to be set out to suit the conditions of the site and existing works if any and the Architect's proposals. Do not scale - please ask for information. Some notes may not apply.

DEMOLITION AND TEMPORARY WORKS

Demolition to be carried out in accordance with BS 6187 and Health and Safety Executive Guidance Notes GS29/L 3 and 4. Openings in existing buildings to be formed according to the recommendations of BRE Good Building Guide no. 20 "Removing Internal Load Bearing Walls in Older Dwellings". The Contractor is to be responsible for the stability and structural integrity of the Works. Design, supply and maintain during the execution of the Works all shoring, strutting, bracing and other temporary works as may be necessary.

FOUNDATIONS

Foundations to be grade 30. Use sulphate resisting cement below d.p.c./d.m. if recommended by Building Control officer. Excavation and filling to be in accordance with BS 8000:Part 1.

LINTELS

Lintels in external walls if not specified on the drawing to be Cambric or similar proprietary prestressed steel lintels as recommended by their manufacturer for use in the particular situation and loading. Bearing as recommended by manufacturer (normally 150). Lintels in internal walls to be Simpson Concrete Ltd prestressed lintels with 150 minimum bearing.

MASONRY

Blocks 3.5 N lightweight blocks unless noted otherwise, to conform with the insulation value specified by the Architect. Facing bricks to be as specified by the Architect. Common bricks to be clay Reton bricks with a compressive strength of 20 N/mm² or more unless specified otherwise. All new blocks and bricks to be manufactured under special manufacturing control to BS 5028: part 1 : 1992. Mortar to be one of the following: 1 : 1 : 5 cement : lime : sand or 1 : 1 : 5 to 6 cement : sand or unless otherwise stated. Close cavity with d.p.c. and ties at all openings in cavity walls.

STEEL FINISHES

Galvanizing or other finishes specified to be in accordance with the NBS section 10.

STRAPS

Walls to be strapped to floors using 30 x 5 galvanized mild steel straps of 2,000mm length, spaced at 2,000mm centres and bolted to the wall and backing between first joist and the wall. Strap to be hooked type, turned over a whole block. All new wall plates at eaves to be strapped down to walls using 30 x 5 galvanized mild steel straps at 2,000mm max. centres secured securely to masonry with four 50mm no. 10 screws, and fully nailed to timber.

STRUCTURAL STEELWORK

All steelwork to be in accordance with BS 5950 and the National Structural Steel Specification. All steel to be BS EN 10025 S275 JR. Grade S275 structural steel to be BS EN 10025 S275 JR. All members to be grade S275 unless noted otherwise, except for structural hollow sections which are generally to be hot formed BS EN 10210 S235 J2H or 'Celnic'. Cold formed hollow sections not permitted unless specified as such on the drawings. Connections: All bolts to be grade 8.8, minimum 16mm diameter, in holes 2mm bigger than nominal bolt size, unless otherwise stated. Welds to be minimum 4mm fillet welds around the full perimeter of the parts to be connected. All welds to be shop welds, but site welds may be used with prior agreement of the Engineer and Building Control Officer and may be subject to testing at Contractor's expense. Double beams to be bolted together using M16 bolts at 1,500mm max centres with steel tube spacers. Fasteners to be grade 304 stainless steel. Approval of the CA and Building Control Officer's permission may be required for the use of stainless steel. All stainless steel to be at least 30% more than specified. Alternatively, stainless may be cut carefully using an angle grinder from present lengths of appropriate size. Beam bearings on padstones to be full width of padstone if up to 150mm, or at least 2/3 of the length of the padstone in the direction of the beam span if greater than 150mm, unless otherwise specified on the drawings. Fire protection All steel to be protected from fire to 30 minute standard of A1 specified elsewhere in the satisfaction of the CA and Building Control Officer (BS7003).

STRUCTURAL TIMBER

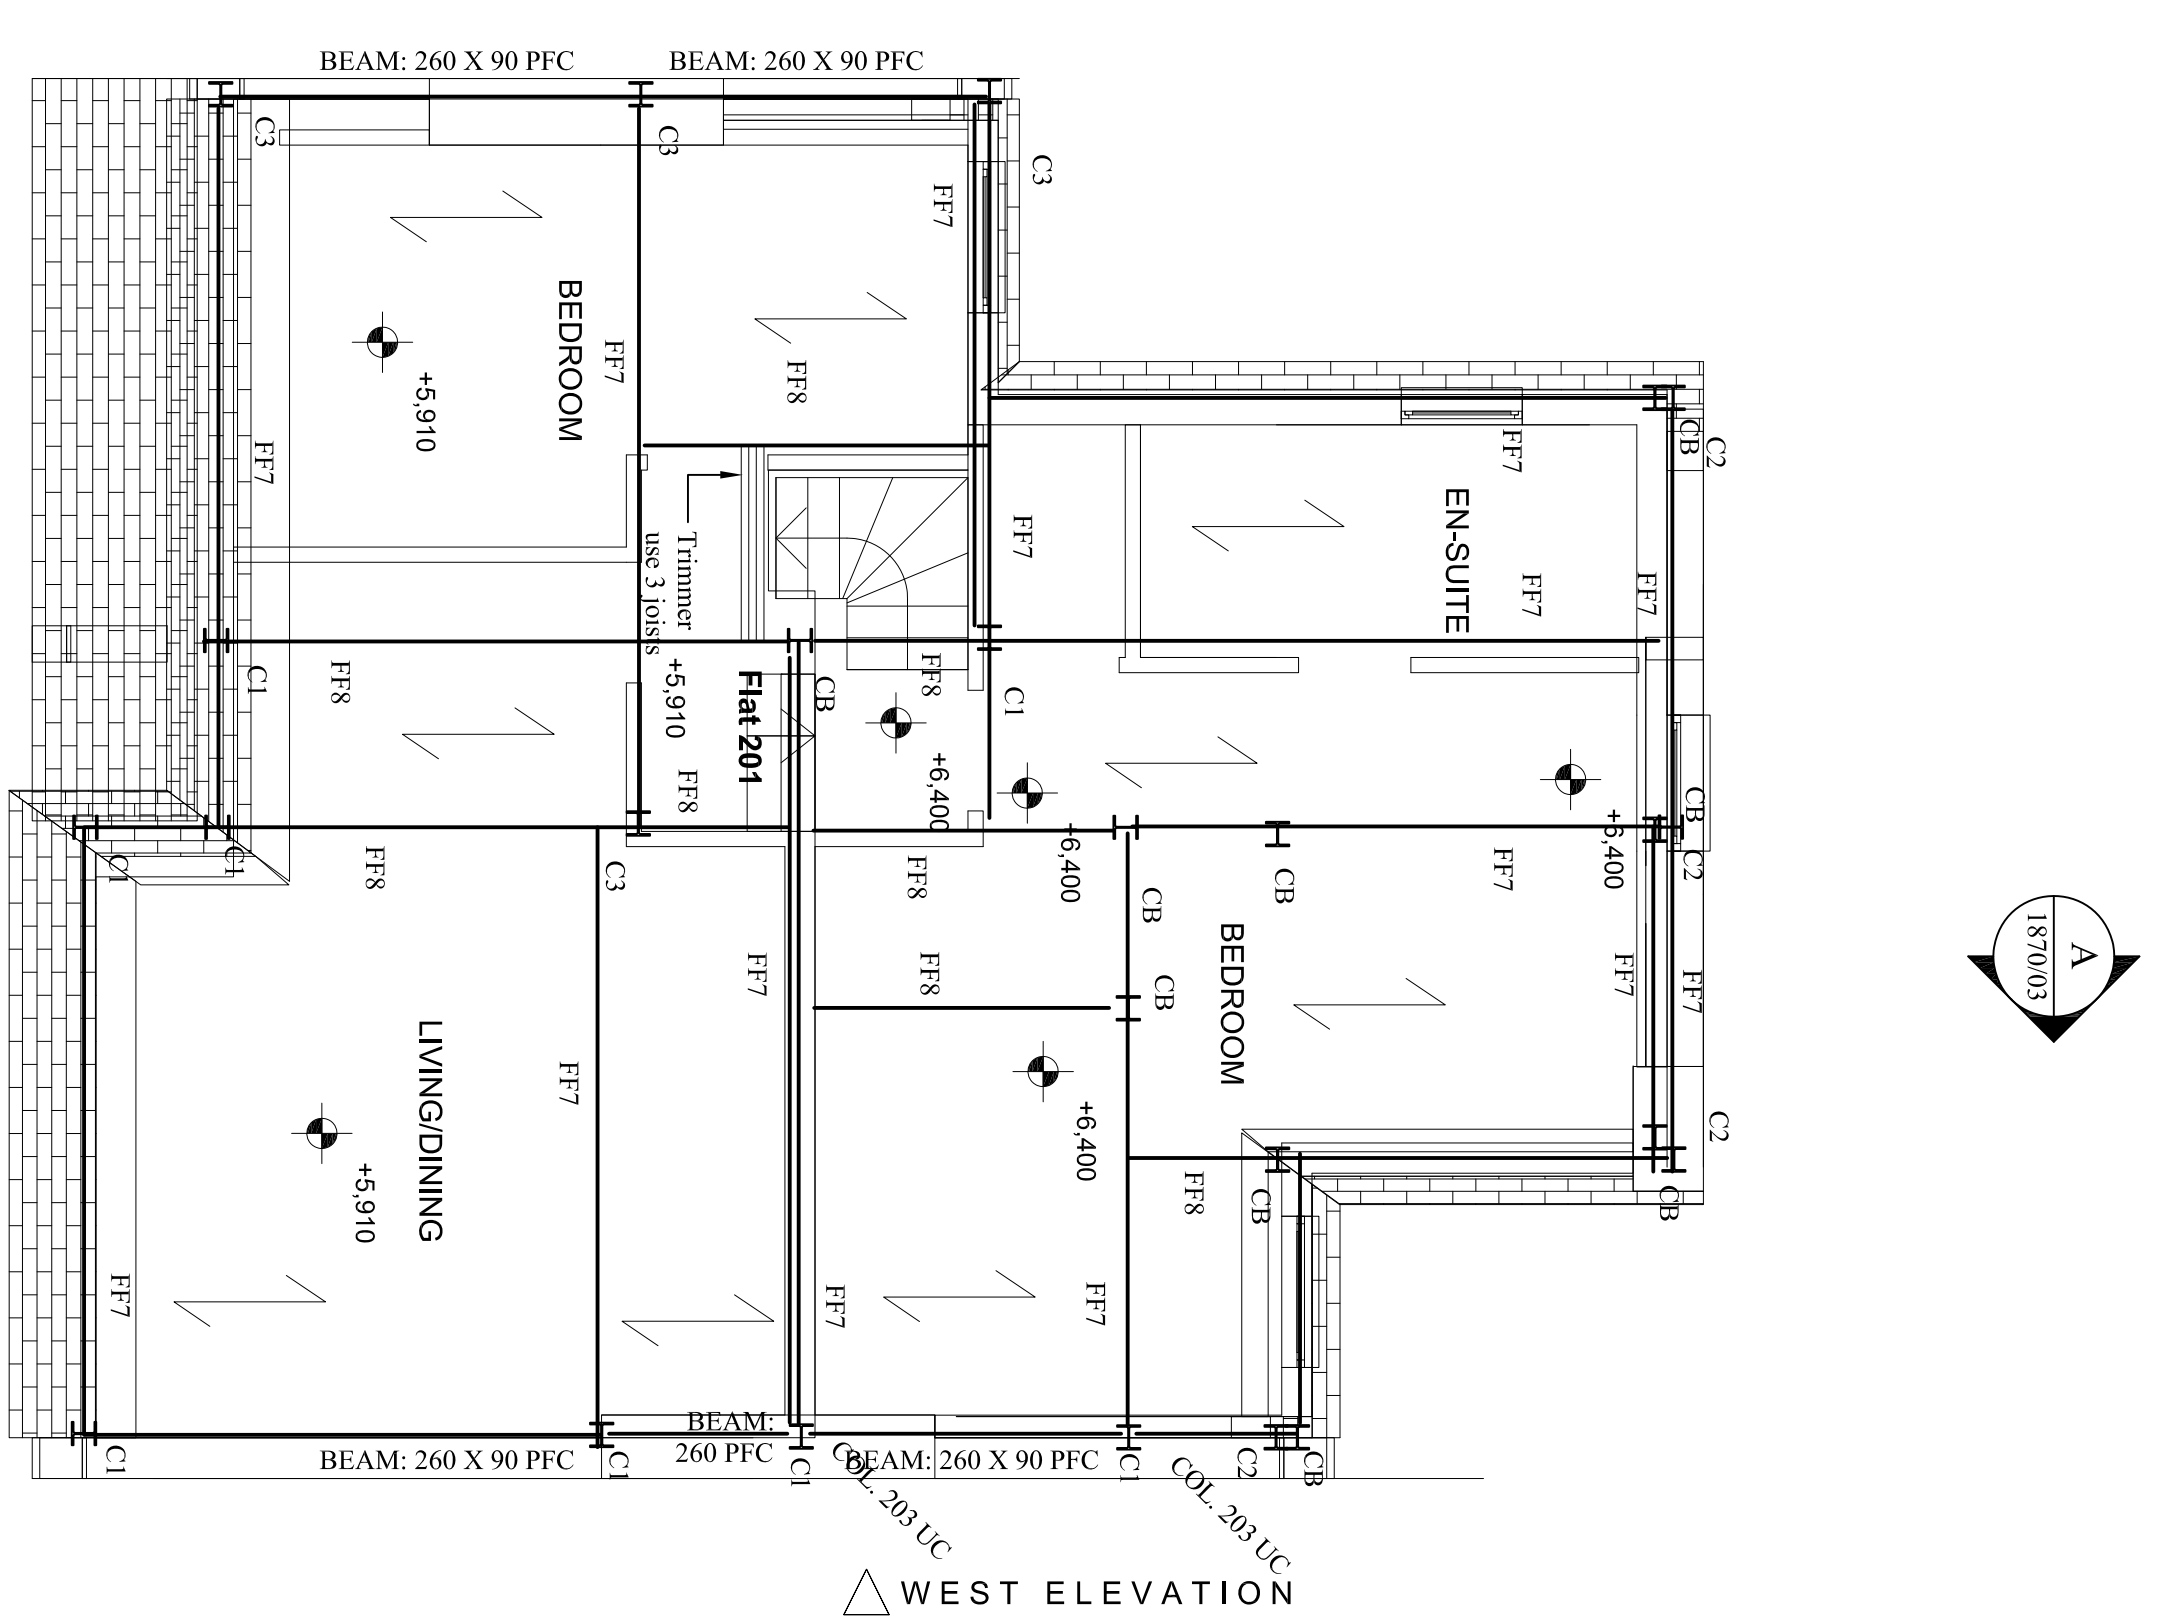

All timber grade C16 unless otherwise stated. Multiple members to be bolted together using M12 bolts at 800 max centres, 50 alternately from top and bottom, with 50mm plate washers both sides. Joists may be notched over bearing, maximum depth of notch 1/3 joist depth unless otherwise specified on the drawing. Provide solid blocking to joists at bearings unless built in to masonry, and one row at mid span for spans between 2,500mm and 4,500mm, or two rows equally spaced for spans greater than 4,500mm. Blocking to be 50mm x min. 75 joist depth or use an approved purpose made proprietary blocking 95x118 joist depth, and should not be closer to the support than 0.07 of the span or further away than 0.25 of the span. Holes in joists should be no greater in diameter than 1/4 the depth of the joist, should be drilled at the middle of the joist depth, and should be at least 3 diameters (centre to centre) apart, and should only be located between 1/4 and 2/3 of the span from the support. Joist hangers for masonry support should be of the hooked restraint type (or provide separate straps as specified) and of the correct size. Timber to timber connections to be made using correct size steel hangers. All steel connectors must be fully nailed in all available holes using the manufacturer's recommended nails e.g. 30mm square twisted strand nails. Stud in load bearing studwork to be 100 x 50 C16 studs at 400 max centres, 50 x 100 C16 stud in load bearing studwork at max 1200 vertical centres to suit plasterboard size.

SECOND FLOOR PLAN
SCALE 1:50

COMBLOOR 80 L2 THICK WITH A252 MESH AND CONCRETE C30.

STEEL FRAME TO BE CONSTRUCTED AT AN EARLY STAGE TO ACT AS TEMPORARY SUPPORT TO PARTY-WALL AND EXISTING WALLS TO BE RETAINED. FOUNDATION PADS TO BE CONSTRUCTED BELOW FORMATION LEVEL, TO ALLOW STEEL COLUMNS TO BE INSTALLED AND STEEL FRAME ERECTED PRIOR TO COMMENCEMENT OF GENERAL CONSTRUCTION.

KEY

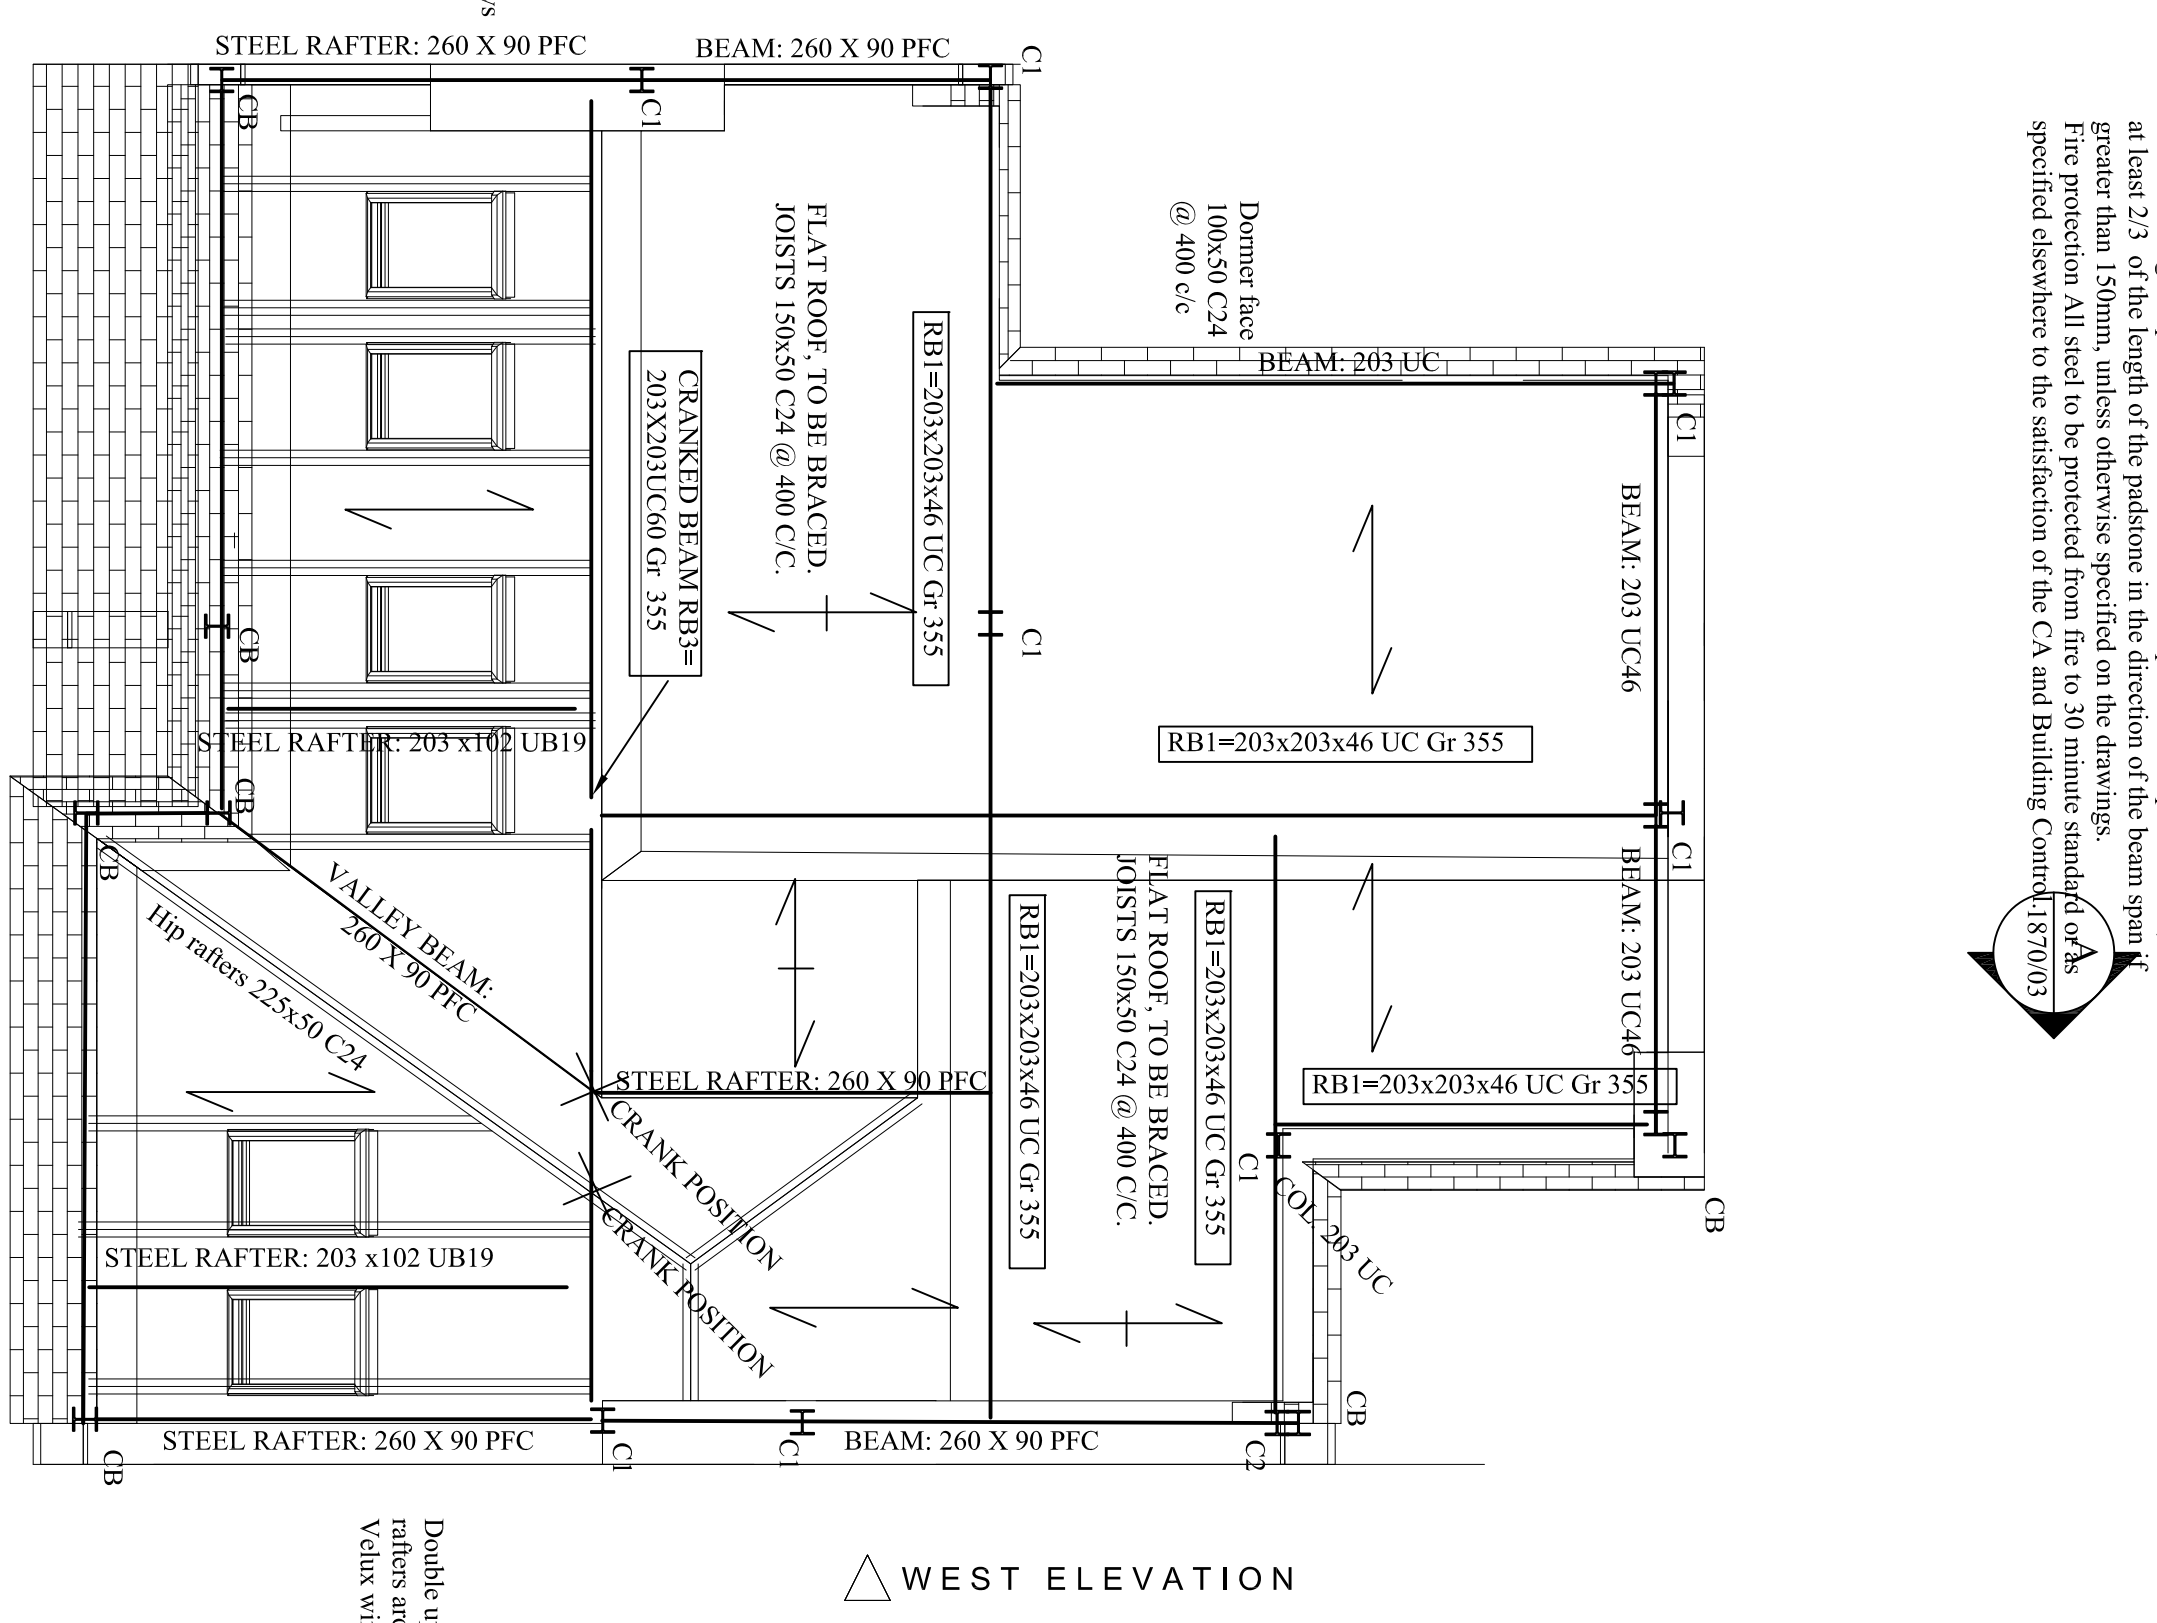

COMBLOOR 80 L2 THICK WITH A252 MESH AND CONCRETE C30.
