1. Introduction

Two alternative solutions have been developed in recent weeks for the support of the slab below the existing dome following a review of the size of the opening required in the dome slab. One of these solutions has similarities to the previous proposal forming part of the current listed building consent while the other is prepared as a viable option with several additional benefits. The two solutions are described and compared within the text of this report.

2. Existing Structure

The existing dome slab construction is a clinker concrete infill between steel joists at approximately 1.2m centres. The joists span between four primary steel girders which span the approximately 11m between piers to the front elevation of the club and the replacement truss on the opposite elevation of the dome area. It was identified early in the design programme that the capacity and condition of the existing filler joists did not allow for the additional loading and robustness requirements associated with using the area as a bar, and as such some strengthening was seen to be required. The strengthening method originally proposed included for large steel beams running below the slab to reinforce it while the alternative option proposed here includes for replacement of the concrete slab so as to mitigate the need for the additional strengthening steels.

3. Proposed Options

3.1 Option 1 – Steel Option

This option, most similar to that of the previously agreed solution includes large steel beams spanning below the existing slab to add additional support to the filler joists. An 850mm deep beam is proposed to span along the front elevation of the building to transfer loads between piers. This beam is to be partially chased into the existing brick parapet so that it can sit behind the new dome construction.

Positives

- + Similar to agreed solution
- + Clinker concrete retained

Negatives

- + Some large temporary works required to install steelwork which may impact historic fabrics
- + Strengthening works to front piers is likely to be more significant (but within the limits of what has been previously agreed)
- + A large opening to be formed in the dome slab, and existing primary steels removed
- + Primary load-path is through edge piers which are more difficult to access

NEW & EXISTING BEAMS HUNG FROM UB 838 STIFFENERS STIFFENERS STOM SDAN DLY-PACK SDAN STECH BEAM SECTION C-C

1:10CA3

3.2 Option 2 – Slab Option

In order to achieve this option, we've worked with the architect to minimise the required stair opening and locally modify the existing beams to achieve regulation head height. This has in turn allowed us to develop a solution with significantly less deviation from the historic design solution. For this option to work, the existing clinker concrete filler-joist slab needs to be replaced with a new lightweight reinforced concrete slab sitting between the retained filler-joists and spanning between the existing primary girders.

Positives

- + Reduced requirement for modification to the existing loadpath
- + Reduced steelwork requirement
- + Reduced temporary works requirement
- + Removal of the 850mm deep beam running along the front elevation of the building
- + Reduced opening in the existing dome slab

Negatives

- + Clinker concrete replaced with a new reinforced concrete slab
- + Solution has less similarities to the currently agreed solution

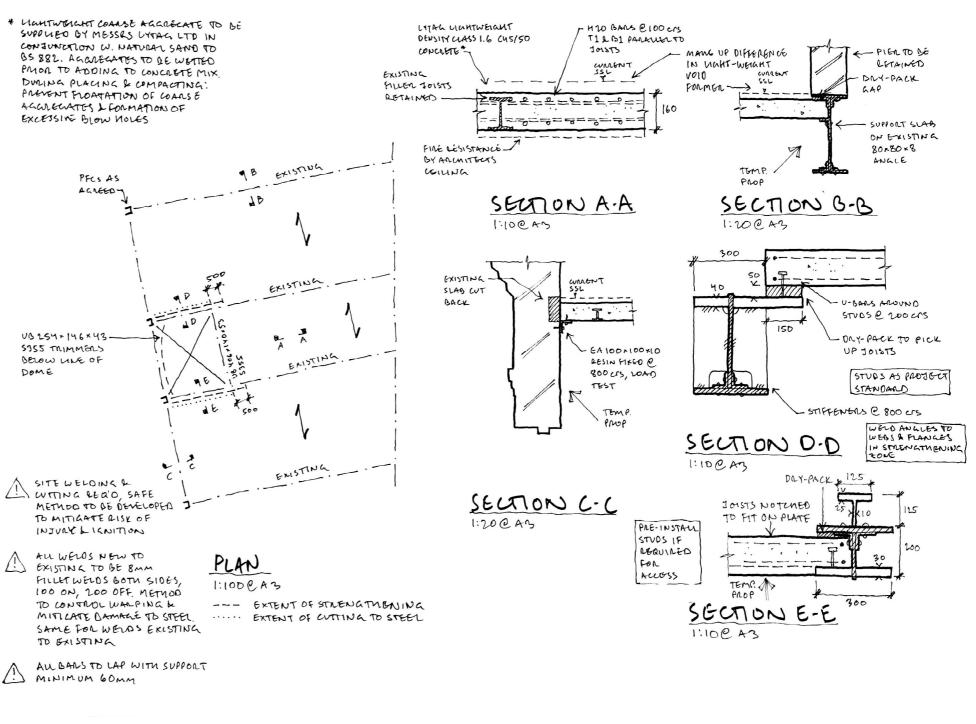

Image 3 - Option 2 Scheme

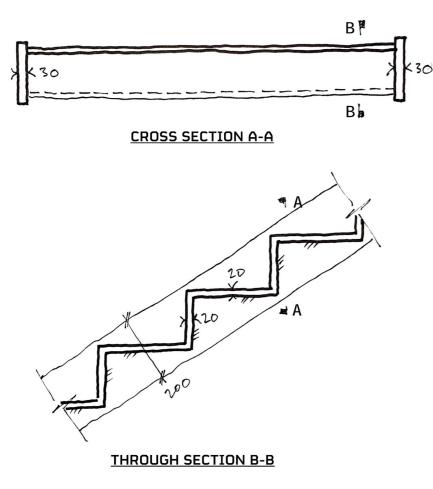

3.3 Stair

The architectural design of the stair has been interrogated to facilitate option 2. It is critical that the stair fits within the new opening in the slab, and the architectural solution shows a folded plate stair with approximately 280mm goers and 175mm risers. We have reviewed this solution and believe that it can be achieved with a curved steel plate stringer 200x30 S355 on each side with the risers and goers as 20mm thick steel plates S355 fully welded into the stringers to control rotational overturning of the stair. These are envisaged to fix into the side of the modified steel beam at the top of the stair with the remaining steps infilled above this point. A detailed vibrational analysis of the stair construction is required, and the final design is by the contractor.

4. Conclusion

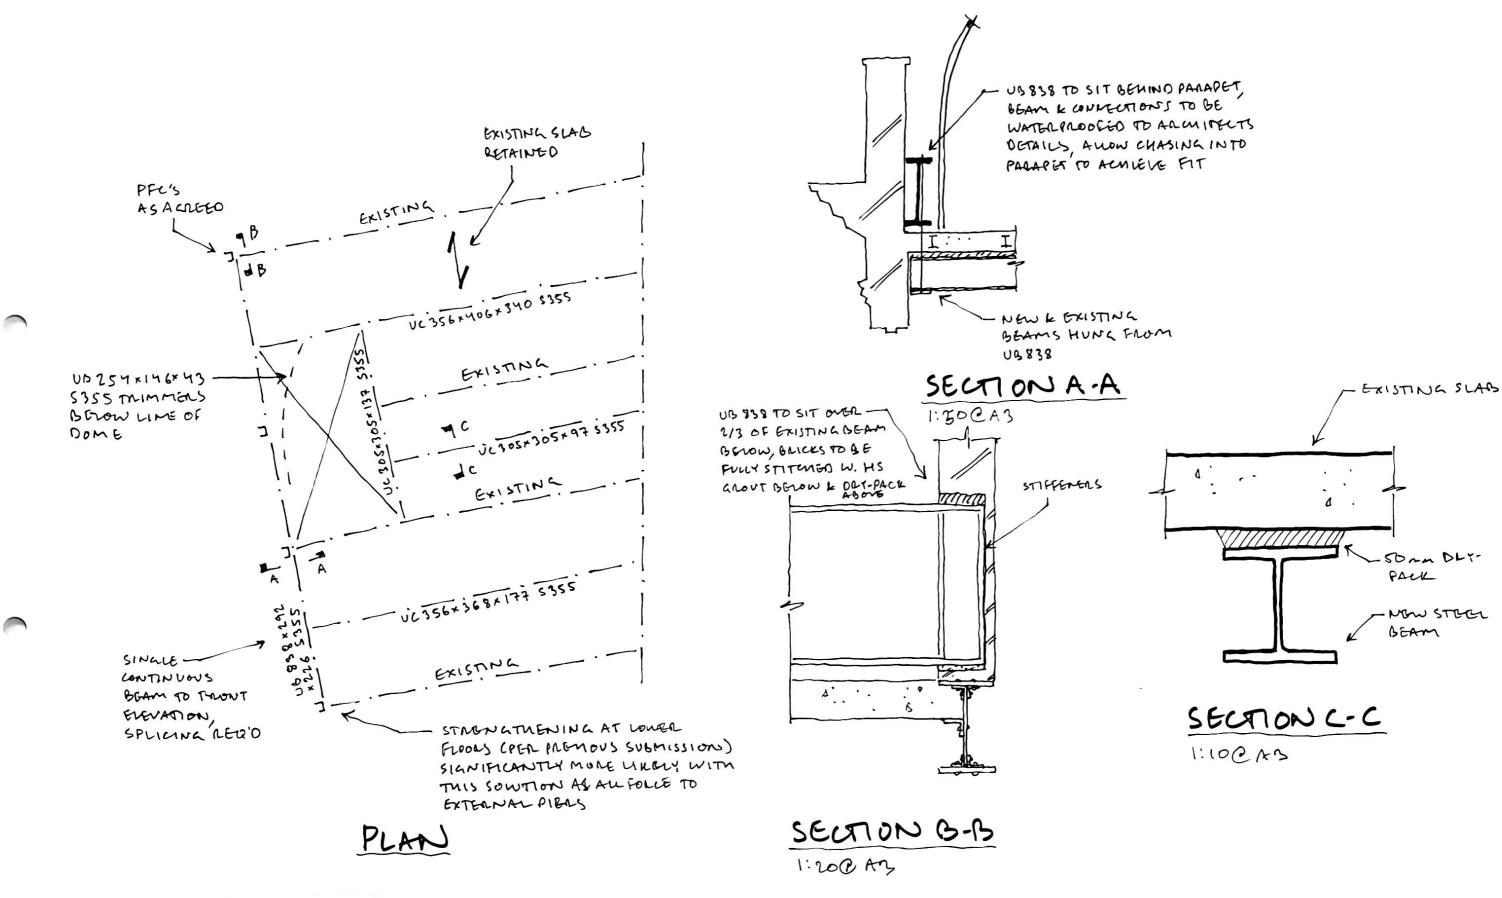

Two solutions are presented within, both achieving the geometrical requirements for the proposed use of the space, and both requiring some modification to the existing fabric. While option 1 is more aligned with the currently consented scheme, it is seen that option 2 may better respect the historic structure by retaining the existing aesthetic and the existing load-path. This second option was not originally feasible with the dome retained, but in line with the proposed reconstruction it can now be achieved.

The HTS structural recommendation is that option 2 is pursued as it keeps the original load-path intact, reduces the need for large and complex temporary works and helps de-risk the works to the front piers.

Koko - Comments on Dome Connections

Introduction

HTS have carried out an assessment of the connection details provided by SLHA. The following items provide commentary on how these can achieve their required structural performance and robustness.

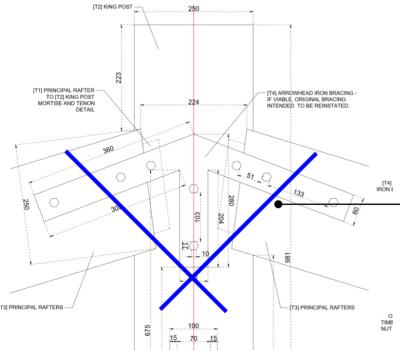

Other than the details provided below, we note that all bolts, washers, nuts and other iron elements are to be replaced with equivalent size steel elements of grade 8.8 or strength S275 as is relevant for the particular item.

Most of the connections are traditional and rely on bearing between elements, a suitably capable contractor to be appointed to carry out the works and ensure that sufficient bearing transfer is achieved through surface preparation and fit of elements.

We note further that all timber is to be of strength grade C24, and that all screws to have pre-drilled holes which are to be sized and installed per Rothoblaas requirements. All screws to be into element centre lines unless noted otherwise and to be applied to every location.

Connections

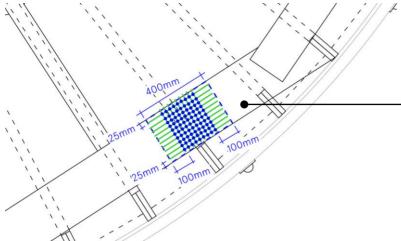

A key for the items below is presented at the back.

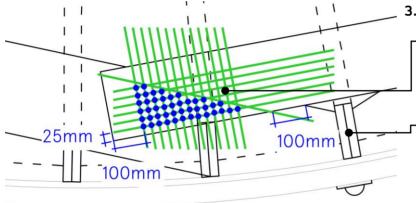

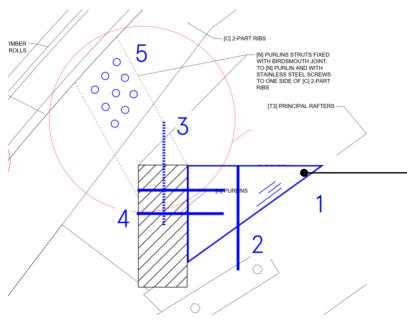

1. Principal Rafters to King Post

No intervention is required if the iron bracketry is replaced with S275 steel as per the introductory statement, however, and as indicated, if this is to remain as puddled iron, a further set of hidden resin dowels will be required within the timber. These are to be designed by the specialist subcontractor to carry a minimum of 10kN in shear and tension.

Heyne Tillett Steel Ltd is a Private Limited Company registered in England and Wales No. 7155581 Registered Office 4 Pear Tree Court, London EC1R ODS

2. Lap in Wall Plate

It is proposed that the wall plate is locally lapped to achieve better head height between two trusses where a new door opening is proposed. To achieve this, the timbers are to be lapped by minimum 400mm, and screws are to be installed from above at 25mm centres with edge distance requirements as shown.

Rothoblaas TBS8200 screws @ 25mm crs.

3. Wall Plate Corner Details

The lapping corner timber are to be fixed down into the wall plates with screws at 25mm crs and edge distance requirements as shown.

 Note that a compressive force is required through the indicated bearing area between the two wall plates and that these should be prepared with a suitable surface finish and interface.

Rothoblaas TBS8120 screws @ 25mm crs.

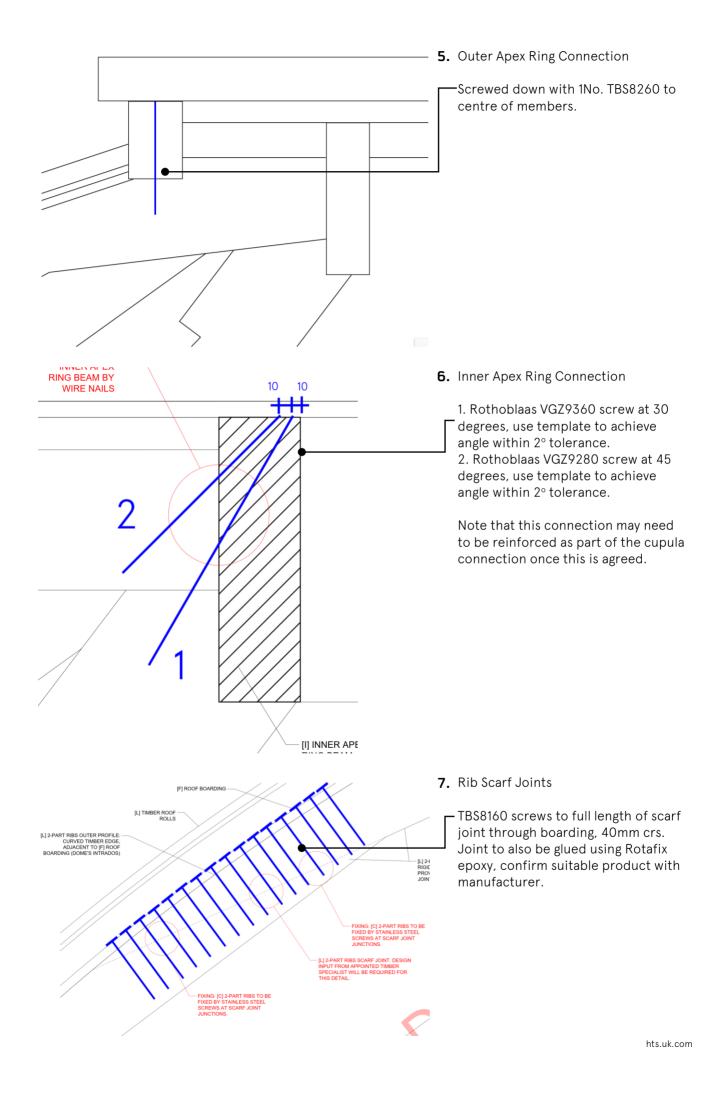

4. Purlin Strut Connection

 A new timber wedge to be introduced, width as principal rafter, grain direction as principal rafter (indicated).

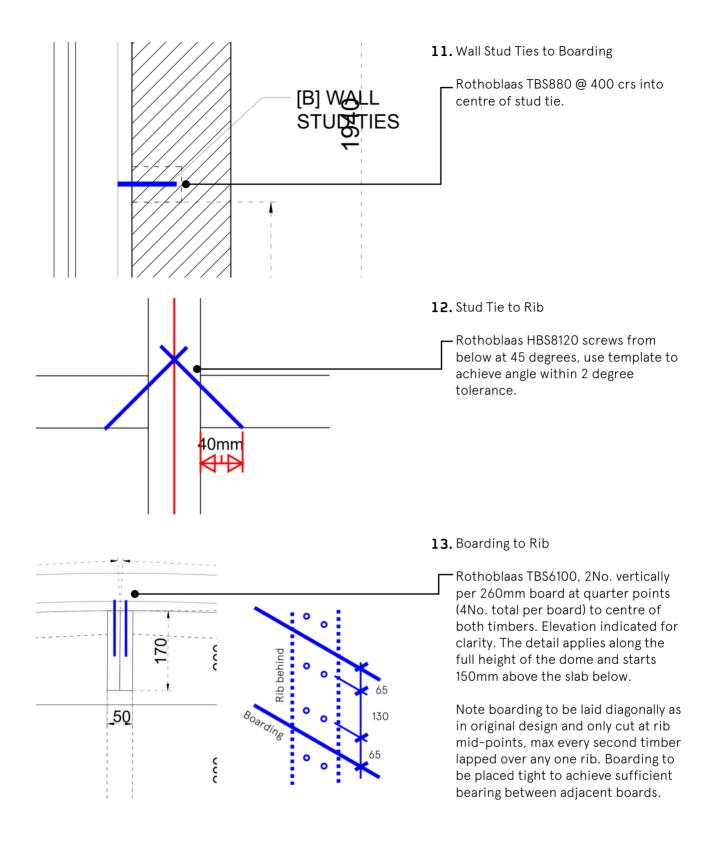

2. 2No. Rothoblaas TBS8220 screws to centre of top face of wedge, 25mm crs and edge distance. To centre line.

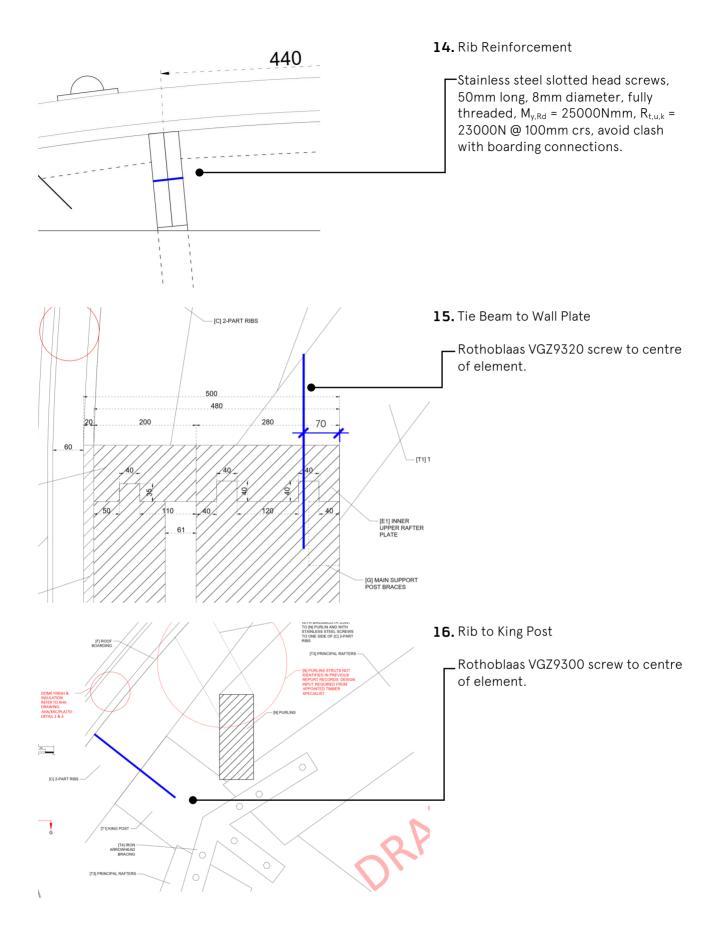

3. Rothoblaas TBS8110 screw to member centre lines.

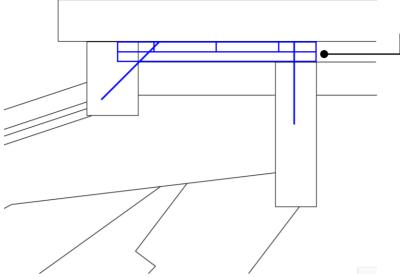

4. 2No. Rothoblaas TBS8160 screws, 50mm crs and edge distance. To centre line of adjoining timber. 5. Perlin struts minimum 50mm wide. Stainless steel slotted head screws, length as total depth of both elements minus 10mm, 8mm diameter, fully threaded, $M_{y,Rd}$ = 25000Nmm, $R_{t,u,k}$ = 23000N

17. Roof Boarding

 2 layers of 20x150mm roof boarding laid in perpendicular directions to form diaphragm above apex rings. Rothoblaas TBS8200 screws @ 100 crs into apex rings (outer at 45 degrees). Layers of roof boarding also to be fixed to one another with rothoblaas SHS3530 to element centres (150mm centres in each direction.
