

No immediate after-care is required at the time of installation. Each GrufeTile comes to site fully established with pre-grown vegetation eliminating the need of any irrigation. Here's how to ensure your green roof stays in good condition:

- Hand weed and remove unwanted seedlings
- Clear gutters or drainage outlets of vegetation
- Feed the roof with organic phosphate and potassium
- Ensure stone perimeters are clear of dead and live plants
- Clear any leaves that have fallen from deciduous trees
- Maintenance should be carried out in early Autumn.
- Where breeding birds are expected, this should be undertaken once the nesting season has ended.
- Sedum will go red when stressed through dry or cold weather and sometimes when it is low on organic nutrients. This does not mean the roof is dead. You can either wait for rain or irrigate the roof once a week for approximately 1 hour.
