

RIEFA

Green Roofing Solutions

- ✓ Ultra-lightweight green roof solution for architects, specifiers and self-build projects
 - ✓ Green roof system weighs only 36kg per m² when fully saturated
 - ✓ Complete low profile system is only 75mm thick
- ✓ Excellent water retention levels of 11 litres per m² and percolation rate of 1 litre per hr
- ✓ A genuine totally organic, low cost growing medium for green roofs

RIEFA Board Technical Information	
Board size	1.2m x 1m x 36mm
Installation requirements	1 layer of 36mm board
Board weight (dry)	8 kg per m ²
Board weight (wet)	15 kg per m ²
Complete system weight (saturated)	36 kg per m ²
Complete system profile depth	75 mm

- 100% organic
- Lightweight. Only 36Kgs per m² as complete system
- Low profile. Use as single layer. Total 36mm
- Quick easy fit. One person can fit
- No specialist knowledge required
- No structural upgrade or reinforcement required

A REVOLUTIONARY GREEN ROOFING SYSTEM

Riefa Board is a unique organic growing medium for green roofing systems. With its revolutionary lightweight credentials, it does away with the need for structural upgrades when applied to existing roofs and thereby makes it highly affordable when compared to the much heavier standard systems.

What is the Riefa board made from?

The Riefa board is packed full of nutrients that plants love. It is made of rye flour and a number of top secret ingredients that are all organically grown from sustainable and natural resources. The board benefits from a coir backing that helps retain water within the system. Riefa Board is a genuine green product.

How is it installed?

It is quick and easy to install. Once the waterproof membrane has been fitted, it is a simple case of placing a single layer of Riefa board over the membrane and then adding the pre-grown vegetation blanket on top for immediate and stunning results.

What type of roof can I install the Riefa system?

It is very flexible and has been designed to fit smoothly on to sloping, pitched or even shaped roofs. The complete green roof system has a low-depth profile of only 75mm and can be seamlessly fitted to new builds as well as worn out roofs. It is ideal for outbuildings as well as residential and commercial properties.

How heavy is the Riefa Green Roof System?

It is extremely lightweight which makes it easy to transport and distribute across the roof and therefore quick to install. Even when saturated with rain, the system only weighs 36kg per m². This means that contractors do not have to create the support structures typically required for standard green roofing systems that need heavy drainage layers and granular fill.

What about maintenance?

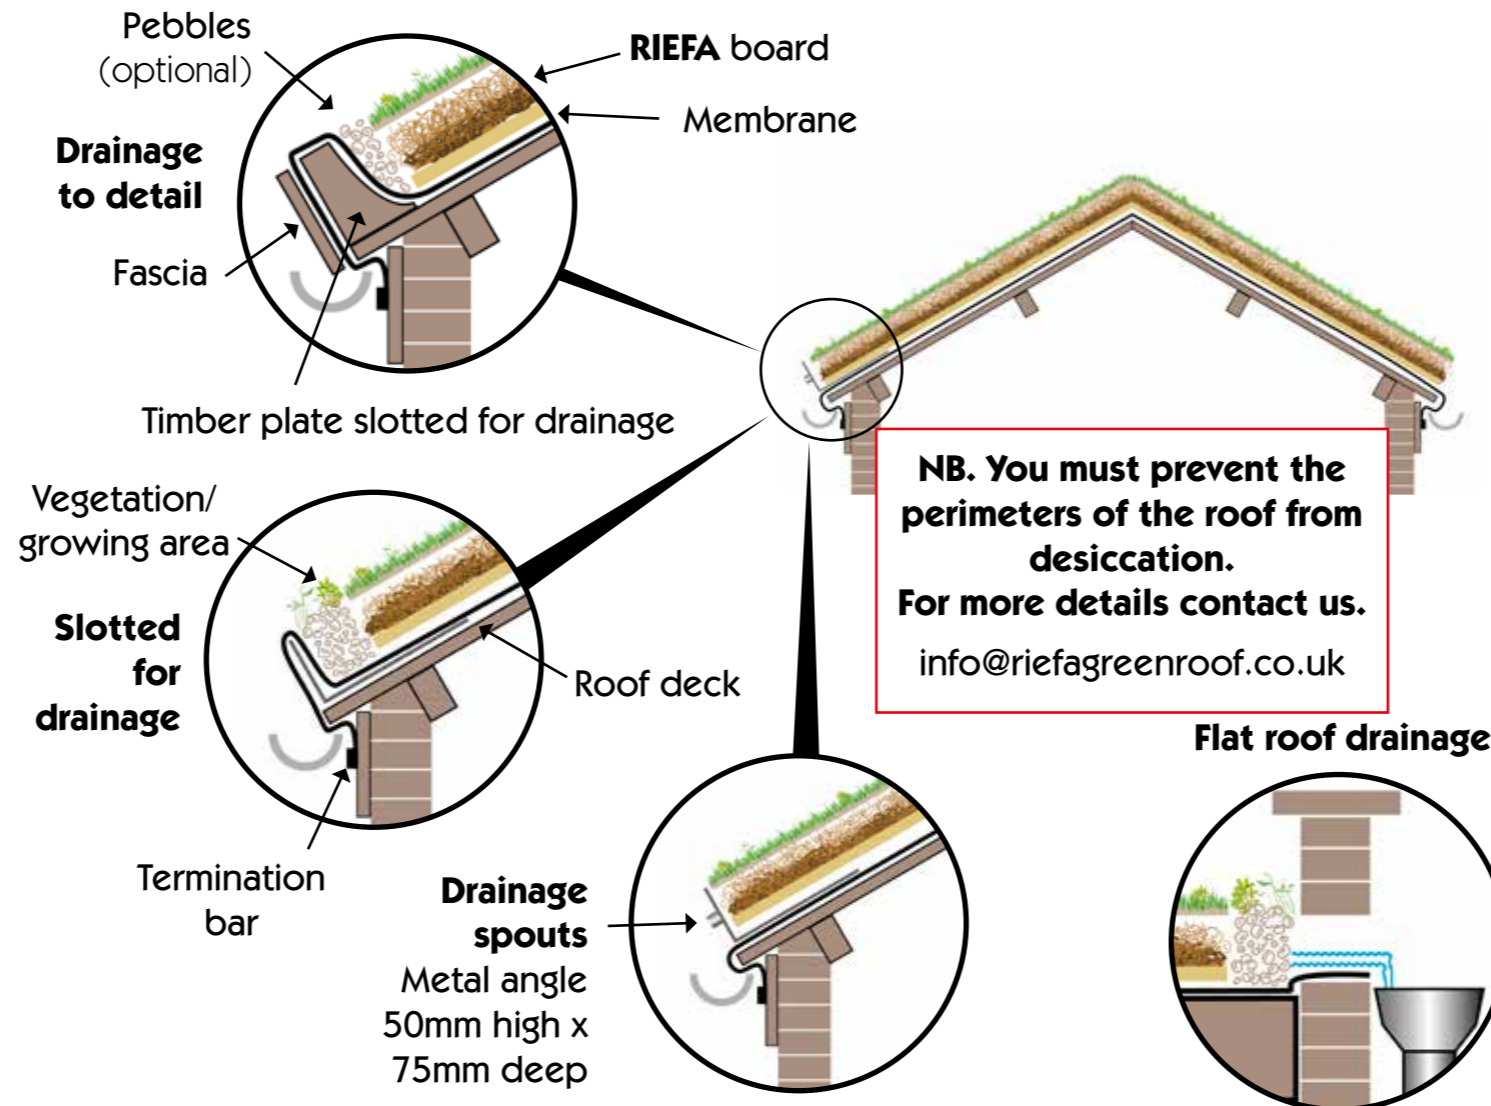

The Riefa green roof system requires very little maintenance. However, in common with all living roofs, the nutrients in the growing medium will become depleted as the plants grow and via the action of rainfall. It will be necessary to feed the roof with a low-nutrient fertiliser that will boost the root stock (e.g. a proprietary autumn lawn feed).

Your RIEFA roof

RIEFA can be installed on to most roofs.

Ask for advice on pitches over 30° about break-bars and anti-slip measures.
