APPENDIX B:	Scheme Proposals and Manufacturer's Data Sheets
APPENDIX C:	Mechanical Plant Noise Prediction Model

#### 1. INTRODUCTION

Thirdway Interiors are seeking planning permission to install new mechanical services plant at Block A, 425 Centric Close in Camden. The proposed units would be located externally at the rear of a ground floor commercial unit which has flats directly above. Accordingly, a noise impact assessment is required.

Spectrum Acoustic Consultants have been instructed by Thirdway Interiors, to carry out a Noise Impact Assessment to support the application. This report is submitted with the intention of providing sufficient information to both inform and satisfy the requirements of the Local Planning Authority.

#### 2. SITE DESCRIPTION & PROPOSALS

The development site is located at 425 Centric Close, Oval Road, NW1 7EP. The scheme is part of a wider development consisting of commercial units at ground floor level, with apartments directly above. Bounding the site to the north are existing flats. To the east are existing commercial and residential properties fronting on to Oval Road. Bounding the site to the south and west is a busy railway line leading Euston Station. An existing site location plan is included in Appendix A.

Proposals involve installing three external air conditioning condensers, as well as a ventilation system which discharges to atmosphere on the north side of the building. The units would provide cooling and ventilation air to a commercial unit which occupies the basement and ground floor levels of the building. The commercial unit would be used during normal office hours only i.e. typically 08:00 to 18:00. Scheme proposals are included in Appendix B.

### 3. NOISE CRITERIA

### 3.1 BS 4142:2014 METHODS FOR RATING AND ASSESSING INDUSTRIAL AND COMMERCIAL SOUND

The noise impact assessment relating to mechanical plant will be carried out in accordance with the procedures set out in BS 4142:2014 *Methods for rating and assessing industrial and commercial sound*. The principle of BS 4142 is to determine an initial estimate of impact of industrial/commercial sound on nearby residents by comparing the Rating Level (sound level from the industrial/commercial source, with a correction applied for any acoustic features that characterise the sound) with the Background Sound Level (*L*<sub>A90</sub> as measured in absence of the industrial/commercial source).

Generally, the greater the difference by which the Rating Level exceeds the Background Sound Level, the greater the magnitude of impact. BS 4142 states that 'a difference of around +10 dB or more is likely to be an indication of a significant adverse impact [...]. A difference of around +5 dB is likely to be an indication of an adverse impact [...]. Where the rating level does not exceed the background sound level, this is an indication of the specific sound source having a low impact.'

However, BS 4142 also advises that 'when making assessments and arriving at decisions [ ... ] it is essential to place the sound in context' so in each case, the context in which the sound is placed must be considered and the initial estimate of impact should be modified accordingly. For example it advises 'Where background sound levels and rating levels are low, absolute levels might be as, or more, relevant than the margin by which the rating level exceeds the background. This is especially true at night.' It also indicates that impacts estimated during 'the middle of the night can be distinctly different (and potentially of lesser importance) compared to the start or end of the night-time period for sleep purposes.'

### 3.2 GUIDELINES FOR COMMUNITY NOISE - WORLD HEALTH ORGANIZATION, 1999 (WHO)

Table 4.1 of WHO references a guideline façade level of  $L_{Aeq,8 hour}$  45dB outside of bedrooms during the night time to avoid sleep disturbance. During the daytime and evening, Table 4.1 recommends a guideline noise level of  $L_{Aeq,16 hour}$  55dB for outdoor living areas to avoid serious annoyance. Whilst noise levels outside of living rooms during the daytime are not listed in Table 4.1, a guideline internal level of  $L_{Aeq,16 hour}$  35dB for habitable rooms is provided to avoid moderate annoyance. Given that a difference of 15dB(A) between noise levels outside and inside of bedrooms during the night time is stated, a guideline noise level of  $L_{Aeq,16 hour}$  50dB outside of living rooms may be assumed.

### 3.3 CAMDEN COUNCIL'S PLANT NOISE CRITERIA

#### Industrial and Commercial Noise Sources

A relevant standard or guidance document should be referenced when determining values for LOAEL and SOAEL for non-anonymous noise. Where appropriate and within the scope of the document it is expected that British Standard 4142:2014 'Methods for rating and assessing industrial and commercial sound' (BS 4142) will be used. For such cases a 'Rating Level' of 10 dB below background (15dB if tonal components are present) should be considered as the design criterion).

Existing Noise sensitive receptor	Assessment Location	Design Period	LOAEL (Green)	LOAEL to SOAEL (Amber)	SOAL (Red)
Dwellings**	Garden used for main amenity (free field) and Outside living or dining or bedroom window (façade)	Day	'Rating level' 10dB* below background	'Rating level' between 9dB below and 5dB above background	'Rating level' greater than 5dB above background
Dwellings**	Outside bedroom window (façade)	Night	'Rating level' 10dB* below background and no events exceeding 57dBLAmax	'Rating level' between 9dB below and 5dB above background or noise events between 57dB and 88dB LAmax	'Rating level' greater than 5dB above background and/or events exceeding 88dBLAmax

 Table 1: Noise levels applicable to proposed industrial and commercial developments (including plant and machinery)

\*10dB should be increased to 15dB if the noise contains audible tonal elements (day and night). However, if it can be demonstrated that there is no significant difference in the character of the residual background noise and the specific noise from the proposed development then this reduction may not be required. In addition, a frequency analysis (to include, the use of Noise Rating (NR) curves or other criteria curves) for the assessment of tonal or low frequency noise may be required.

\*\*levels given are for dwellings, however, levels are use specific and different levels will apply dependent on the use of the premises. The periods in Table 1 correspond to 0700 hours to 2300 hours for the day and 2300 hours to 0700 hours for the night. The Council will take into account the likely times of occupation for types of development and will be amended according to the times of operation of the establishment under consideration.

There are certain smaller pieces of equipment on commercial premises, such as extract ventilation, air conditioning units and condensers, where achievement of the rating levels (ordinarily determined by a BS:4142 assessment) may not afford the necessary protection. In these cases, the Council will generally also require a NR curve specification of NR35 or below, dependant on the room (based upon measured or predicted Leq,5mins noise levels in octave bands) 1 metre from the façade of affected premises, where the noise sensitive premise is located in a quiet background area.

#### 4. BACKGROUND NOISE MEASUREMENT SURVEY

To inform the noise impact assessment, measurements of existing background noise levels were carried out during a noise survey conducted at the site from Thursday 12 to Tuesday 17 December 2019. Weather conditions during the survey were warm and dry, with low wind speeds, presenting good conditions for noise measurement purposes.

Measurements of noise were carried out at the rear of the building at first floor level, in accordance with BS 4142:2014 using an unattended noise logger. The monitoring location is considered representative of the nearest noise sensitive residential receptor locations to the proposed condenser units. Measurements consisted of continuous 15 minute periods. The microphone was mounted on a pole at first floor level. The location of the microphone is shown on the existing site location plan included in Appendix A.

The following instrumentation was used during the survey.

- Bruel & Kjaer Type 2250 Sound Level Meter s/n 3010945
- Bruel & Kjaer Type 4189 Microphone s/n 3060807
- Bruel & Kjaer Type 4231 Acoustic Calibrator s/n 3010648

Before and after the survey, the sound level meter was field-calibrated in accordance with the manufacturer's guidelines, and no significant drift was observed. The meter, microphone and field calibrator are laboratory calibrated biennially in accordance with UKAS procedures or to traceable National Standards.

Measurements made were of the following parameters:

- Maximum Noise Level defined as the maximum (LAmax the maximum noise level)
- Residual Noise Level defined as the Energy Average Level of a period, in the absence of noise from the proposed development (*L*<sub>Aeq</sub>)
- Background Noise Level defined as level exceeded for 90% of a period, in the absence of the noise from the proposed development (*L*<sub>A90</sub>)

The measured noise profile at the noise monitoring location is shown in the following chart.

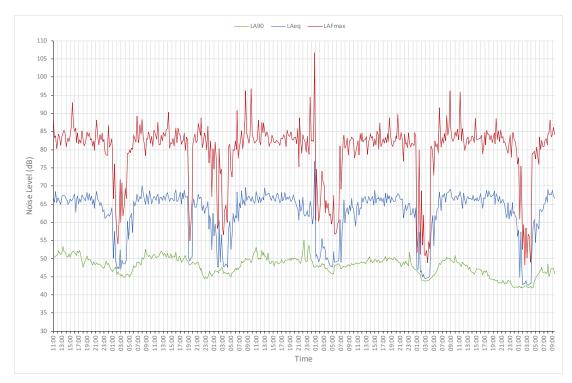

Chart 1: Ambient noise profile - Thursday 12 to Tuesday 17 December 2019.

When determining the representative background  $L_{A90,T}$  level for the relevant period, BS 4142<sup>1</sup> guidance states "a representative level ought to account for the range in background levels and ought not automatically to be assumed to be either the minimum or modal value." With this in mind, statistical analysis has been used to determine the typical background  $L_{A90,T}$  noise level. This analysis derives the Mode, Mean and Mean -1 standard deviation values. Once these three values have been established, a judgement is made as to which value is considered representative. In this instance, both the mean and modal values were the same. Therefore this value is regarded as being representative.

Table 2 shows the representative background noise level measured at the nearest noise sensitive receptor location, during the daytime period when the plant items would be operating.

Measurement Location	Period	Background Noise Level	
Nearest Flats directly above	08:00 – 18:00	<i>L<sub>A90,1hour</sub></i> 49 dB	

Table 2:
 Summary of the representative background noise level measured during the sensitive nighttime period

As shown in Table 2, the representative background noise level at the nearest noise sensitive receptors to the proposed mechanical plant is  $L_{A90, 1hour}$ 49dB during the daytime when the units would be operating. This reflects a typical steady noise profile controlled by other nearby mechanical plant in the area.

<sup>&</sup>lt;sup>1</sup> BS 4142:2014 Methods for rating and assessing industrial and commercial sound

#### 5. ASSESSMENT OF NOISE IMPACT

### 5.1 PROJECTED NOISE FROM MECHANICAL PLANT

The proposed mechanical services plant items would be located at the rear of the building. The external condenser units would be located within a dedicated acoustic enclosure. The manufacturer's data sheets are included in Appendix B. The noise outputs (sound power levels) generated by the units are set out in Table 3 below.

Plant Item	No. of	Overall Sound Power Level dB(A)
Mitsubishi PURY-P250YNW-A	1	80
Mitsubishi PURY-P450YNW-A	1	89
Mitsubishi PUZ-ZM71VHA	1	70
HRU G.1 - Mitsubishi LGH-150RVXT-E	1	66
HRU G.2 - Mitsubishi LGH-200RVXT-E	1	68
HRU B.1 - Mitsubishi LGH-200RVXT-E	1	68
EF B.1 - TD-500/150 SILENT 3V	1	45
EF G.1 - TD-1300/250 SILENT 3V	1	54

Table 3: Sound power levels of the proposed external mechanical plant

The condenser units operate on thermostatic, speed and timer controls according to heat loads and occupation rates and so would not be operating 100% of the time. Whilst a typical on-time for this type of equipment might only 20-35%, a conservative and therefore more robust assessment assumes a 50% on-time for a typical worst-case scenario (ie 50% of all condensers operating at any one time).

Predictions of how the noise from the plant items propagates to the sensitive receptors is determined through modelling undertaken using proprietary software (Predictor<sup>2</sup>) which meets the requirements of ISO 9613 Part 2:1996<sup>3</sup>. The noise model takes account of the following in its calculations procedures:

- Source sound power level (for point, line and area sources)
- Reflection from nearby structures and source directivity
- Distance from noise source (geometric spreading)
- Atmospheric absorption
- · Acoustic screening of intervening structures and topography
- Ground absorption
- · Ground effects (which includes the height of ground relative to the noise source)

Detailed noise calculations of the totals at each receptor location are then computed. To illustrate the model, a diagram showing the distribution and locations of the mechanical plant noise sources, superimposed on a 3D view of the site is included in Appendix C.

<sup>&</sup>lt;sup>2</sup> Bruel and Kjaer – Predictor V11 Environmental Noise Calculation Software Package, Type 7810

<sup>&</sup>lt;sup>3</sup> ISO 9613-2:1996 "Acoustics – Attenuation of sound during propagation outdoors – Part 2: General method of calculation to determine Noise Levels

A first model simulation has been completed, based on the sound power levels of standard (un-silenced) equipment. The results showed an excess over the noise limits, thereby indicating that the following equipment requires noise control mitigation, as specified in Table 4.

Required Noise Mitigation	
<ul> <li>Operate each external condenser units in low noise r</li> <li>Incorporate 10dB in-line silencers into the Heat Reco Unit supply and extract ducts.</li> </ul>	

Table 4: Recommended noise control mitigation for mechanical plant items, as specified

The noise contour map and full table of results are also included in Appendix C for reference.

### 5.2 MECHANICAL PLANT NOISE IMPACT ASSESSMENT

The proposed plant items would run during office hours only. Therefore, the predicted plant rating levels will be compared with the representative  $L_{A90,1hour}$  background noise level measured during the daytime at the nearest sensitive receptor locations.

Table 5 shows a BS 4142 assessment covering the mechanical plant noise impact during the daytime. None of the plant items emit any distinct impulses or tones. However, the plant does emit other characteristics that are distinctive against the existing residual acoustic environment. Therefore, a feature correction has been included in the rating level.

Residential Location	Specific Level (dB)	Character Correction (dB)	Rating Level (dB)	Background <i>L</i> <sub>A90</sub> Noise Level (dB)	Assessment Level (dB) (Background excess)
R1. Plot 36	32	+3	34	49	-15
R2. Plot 37	24	+3	27	49	-22
R3. Plot 38	0	+3	3	49	-46
R4. Plot 70	33	+3	36	49	-13

As indicated in Table 5, the predicted rating levels would be 3-36dB at the nearby residential receptor locations. The predicted rating levels would be 13-46dB lower than the representative background  $L_{A90,1hour}$  level. In line with BS 4142:2014, the noise impact would be very low. The difference between the rating levels and background levels is such that any uncertainty would have no significance on the outcome of the assessment.

The predicted rating levels would not exceed Camden Council's target noise criteria of no higher than 10dB(A) below the measured background noise level at all of the nearby residential receptor locations.

The predicted plant noise levels outside each of the nearest sensitive properties during the daytime are compared with the NR35 criteria below in Table 6.

Receiver	dB		Octave Band Centre Frequency (Hz)							
Location	(A)	63	125	250	500	1000	2000	4000	8000	
R1. Plot 36	32	27	27	24	19	21	15	8	3	
R2. Plot 37	24	19	20	16	10	9	1	-	-	
R3. Plot 38	0	-	-	-	-	-	-	-	-	
R4. Plot 70	33	28	30	26	20	21	15	8	1	
NR35		63.1	52.4	44.5	38.9	35.0	32.0	29.8	28.0	

Table 6: Predicted plant noise levels compared with the NR35 daytime criteria curve

Specific noise levels from mechanical plant would be comfortably lower than the NR35 criteria. Furthermore, specific noise levels from mechanical plant would also be comfortably lower than the WHO  $L_{Aeq, 16 hour}$  50dB advised daytime criteria at all of the nearby residential receptor locations.

In view of the above, noise levels from mechanical services plant would have a very low impact and would therefore be acceptable.

### 6. CONCLUSIONS

At the request of the Local Planning Authority, a noise assessment has been completed relating to the potential impact of noise produced by the operation of proposed mechanical services plant at Block A, 425 Centric Close in Camden, NW1 7EP.

A background noise measurement survey has been conducted at a location representative of the nearest noise sensitive receptors to the proposed plant and predictions of noise have been completed.

Noise limits for the proposed mechanical plant have been established for the sensitive daytime period, based on the representative background noise level and taking account of BS 4142, WHO and Camden Council's criteria for noise. Predictions have indicated that noise levels from mechanical services plant would have a very low impact and would therefore be acceptable.

### 5-1. Sound levels in cooling mode

•Depending on the operation conditions, the unit generates noise caused by valve actuation, refrigerant flow, and pressure changes when operating normally. Please consider to avoid location where quietness is required. For BC controller, it is recommended to be installed in places such as ceilings of corridor, rest rooms and plant rooms.

PURY-P-Y(S)NW-A

•Depending on the operation conditions, the unit generates noise caused by valve actuation, refrigerant flow, and pressure changes when operating normally. Please consider to avoid location where quietness is required. For BC controller, it is recommended to be installed in places such as ceilings of corridor, rest rooms and plant rooms.

## APPENDIX C

Mechanical Plant Noise Prediction Model

# Equipment List Sound Power Levels
