FOREWORD-GUIDANCE NOTES

GENERAL

This report has been prepared for a specific client and to meet a specific brief. The preparation of this report may have been affected by limitations of scope, resources or time scale required by the client. Should any part of this report be relied on by a third party, that party does so wholly at its own risk and LBHGEO disclaims any liability to such parties.

The observations and conclusions described in this report are based solely upon the agreed scope of work. LBHGEO has not performed any observations, investigations, studies or testing not specifically set out in the agreed scope of work and cannot accept any liability for the existence of any condition, the discovery of which would require performance of services beyond the agreed scope of work.

VALIDITY

Any use of or reliance upon the report in circumstances other than those for which it was commissioned shall be at the client's sole risk. The passage of time may result in changes in site conditions, regulatory or other legal provisions, technology or economic conditions which could render the report inaccurate or unreliable. The information and conclusions contained in this report should therefore not be relied upon in such altered circumstances.

THIRD PARTY INFORMATION

The report may present an opinion based upon information received from third parties. However, no liability can be accepted for any inaccuracies or omissions in that information.

1. INTRODUCTION

1.1 BACKGROUND

It is proposed to extend the basement flat of No. 39 Priory Road. This rear extension will form a new living / dining room area opening onto a basement level patio with stepped access to the elevated rear garden. In addition, a new front basement lightwell is also proposed.

1.2 BRIEF

LBHGEO have been appointed to prepare a Surface Water Drainage Assessment & Outline SuDS Strategy to support a forthcoming planning application to be submitted to the London Borough of Camden.

1.3 SUDS GUIDANCE

The government advice is that developers should seek opportunities to reduce the overall level of flood risk through the appropriate application of sustainable drainage systems.

Sustainable drainage systems are designed to control surface water run off close to where it falls and mimic natural drainage as closely as possible. They provide opportunities to:

- reduce the causes and impacts of flooding;
- remove pollutants from urban run-off at source;
- combine water management with green space with benefits for amenity, recreation and wildlife.

The aim is to discharge surface run off as high up the following hierarchy of drainage options as reasonably practicable:

1. into the ground (infiltration);
2. to a surface water body;
3. to a surface water sewer, highway drain, or another drainage system;
4. to a combined sewer.

The London Borough of Camden requires drainage solutions to incorporate SuDS principles as laid out in the Non-Statutory Technical Standards[1] for Sustainable Drainage Systems and the London Plan[2].

For redevelopment sites where there is a net increase in impermeable area, development must include at least one ‘source control’ SuDS measure. Examples of potential Source Control measures include:

- blue/green roof
- rainwater harvesting
- bio-retention
- rain garden
- permeable paving

[1] DEFRA March 2015 Non-Statutory Technical Standards (NSTS) for sustainable drainage systems
[2] London Plan Chapter Five - London’s Responses to Climate Change Policy 5.1.3 Sustainable Drainage

Underground storage/attenuation tanks are not encouraged and are to be used only as a last resort.

The Camden Local plan provides guidance for water and flooding under Policy CC3, where the council will seek to ensure a development reduces the risk of flooding where possible and will require a development to utilise Sustainable Drainage Systems (SuDS) in line with the drainage hierarchy to achieve a greenfield run-off rate where feasible.

Additionally, the Camden Planning Guidance for Sustainability (CPG3) (July 2015, updated March 2018) states the following:

> *"All developments are expected to manage drainage and surface water on-site or as close to the site as possible, using Sustainable Drainage Systems (SUDS) and the hierarchy set out below.*
>
> *The Council will expect plans and application documents to describe how water will be managed within the development, including an explanation of the proposed SUDS, the reasons why certain SUDS have been ruled out and detailed information on materials and landscaping.*
>
> *The Council will expect developments to achieve a greenfield surface water run-off rate once SUDS have been installed. As a minimum, surface water run-off rates should be reduced by 50% across the development."*

1.4 REPORT STRUCTURE

This report describes the site characteristics and the proposed development, following which consideration is then given to the feasibility of different SuDS techniques for this site, in line with the SuDS hierarchy.

An analysis is then presented of surface water run-off and of the attenuation volume that will be required to achieve the required reduction in the predicted run-off rates, taking into account increased rainfall rates due to anticipated climatic change.

A SuDS strategy is then developed including information about the proposed SuDS types, with an aim to reduce the drainage discharge rates as far as can be reasonably achieved in the proposed post-development scenario.

The report is accompanied by detailed calculations and a summary sustainable drainage pro-forma.

2. THE SITE

2.1 SITE LOCATION

The site is located at the junction of Priory Road and Abbot's Place in South Hampstead, within the Priory Road Conservation Area, and may be approximately located by the postcode NW6 4NN or by National Grid Reference 525585, 183920.

2.2 TOPOGRAPHICAL SETTING

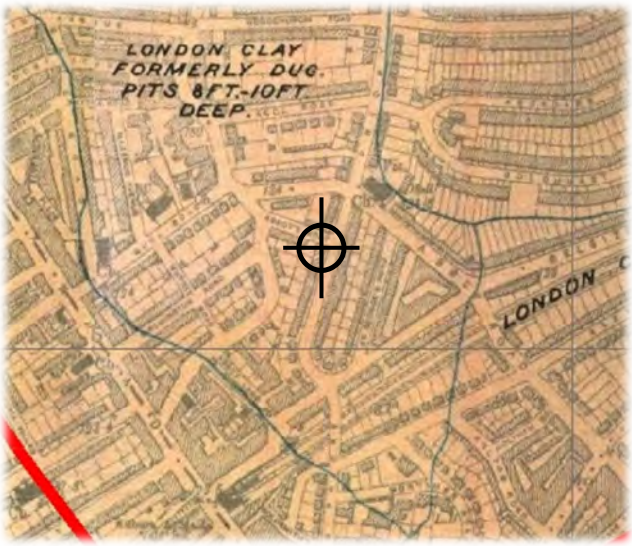
The site lies on the lower southern slopes of Hampstead Hill on land that falls gently to the south.

Tributaries of the River Westbourne run to the west and east of the site. At its closest, the course of the river runs some 125m to the northeast of the site.

2.3 GROUND CONDITIONS

The site is directly underlain by the London Clay Formation, which is essentially impermeable.

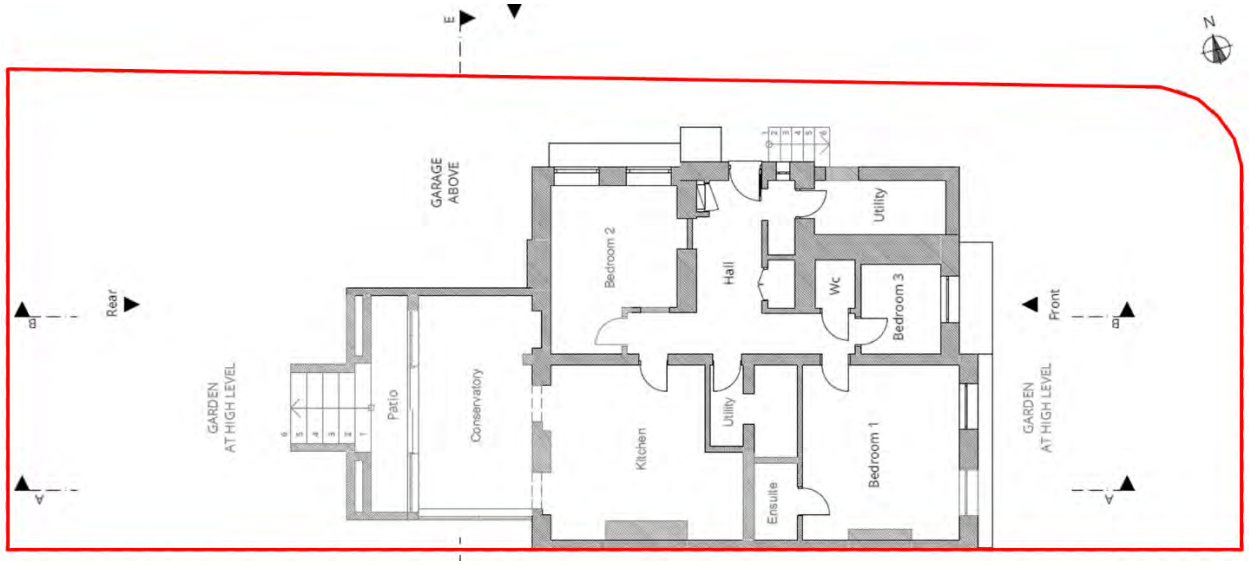
A site specific ground investigation was undertaken in December 2020, confirming that London Clay is present beneath a limited depth of made ground.



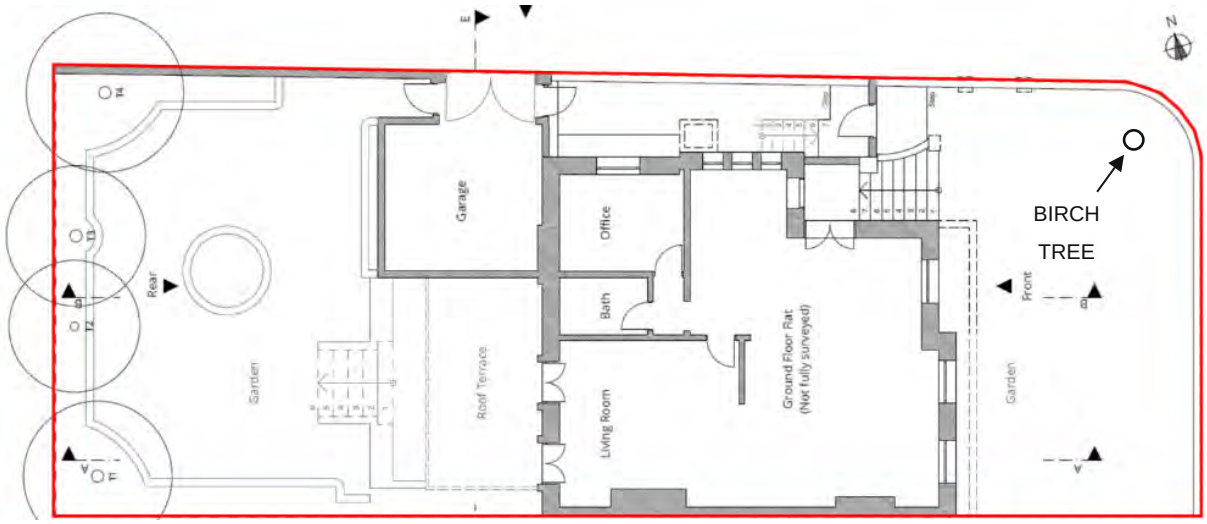
2.4 SITE DESCRIPTION

The site is occupied by a four storey Victorian semi-detached villa. The property comprises a side entrance from Abbot's Place as well as garden areas to the front and rear, both bordered by tall hedgerows. Both the front and rear garden areas are situated at street level.

The building is understood to be divided into four residential units, each occupying a floor level. A garage, accessible from Abbot's Place, is present at ground level, while a conservatory extension is present at basement level with stepped access up to the rear garden. This extension supports a partial roof terrace used by the ground floor flat.



EXISTING LOWER GROUND (BASEMENT) FLOOR



EXISTING GROUND FLOOR

The majority of the rear garden area comprises a hard-surfaced patio with landscaped borders, including four mature trees (two cypress, two lime) at the far rear of the site. A fifth tree, adjacent to Abbot's Place, was recently felled.

EXISTING REAR PATIO / GARDEN

2.5 EXISTING SURFACE WATER DRAINAGE

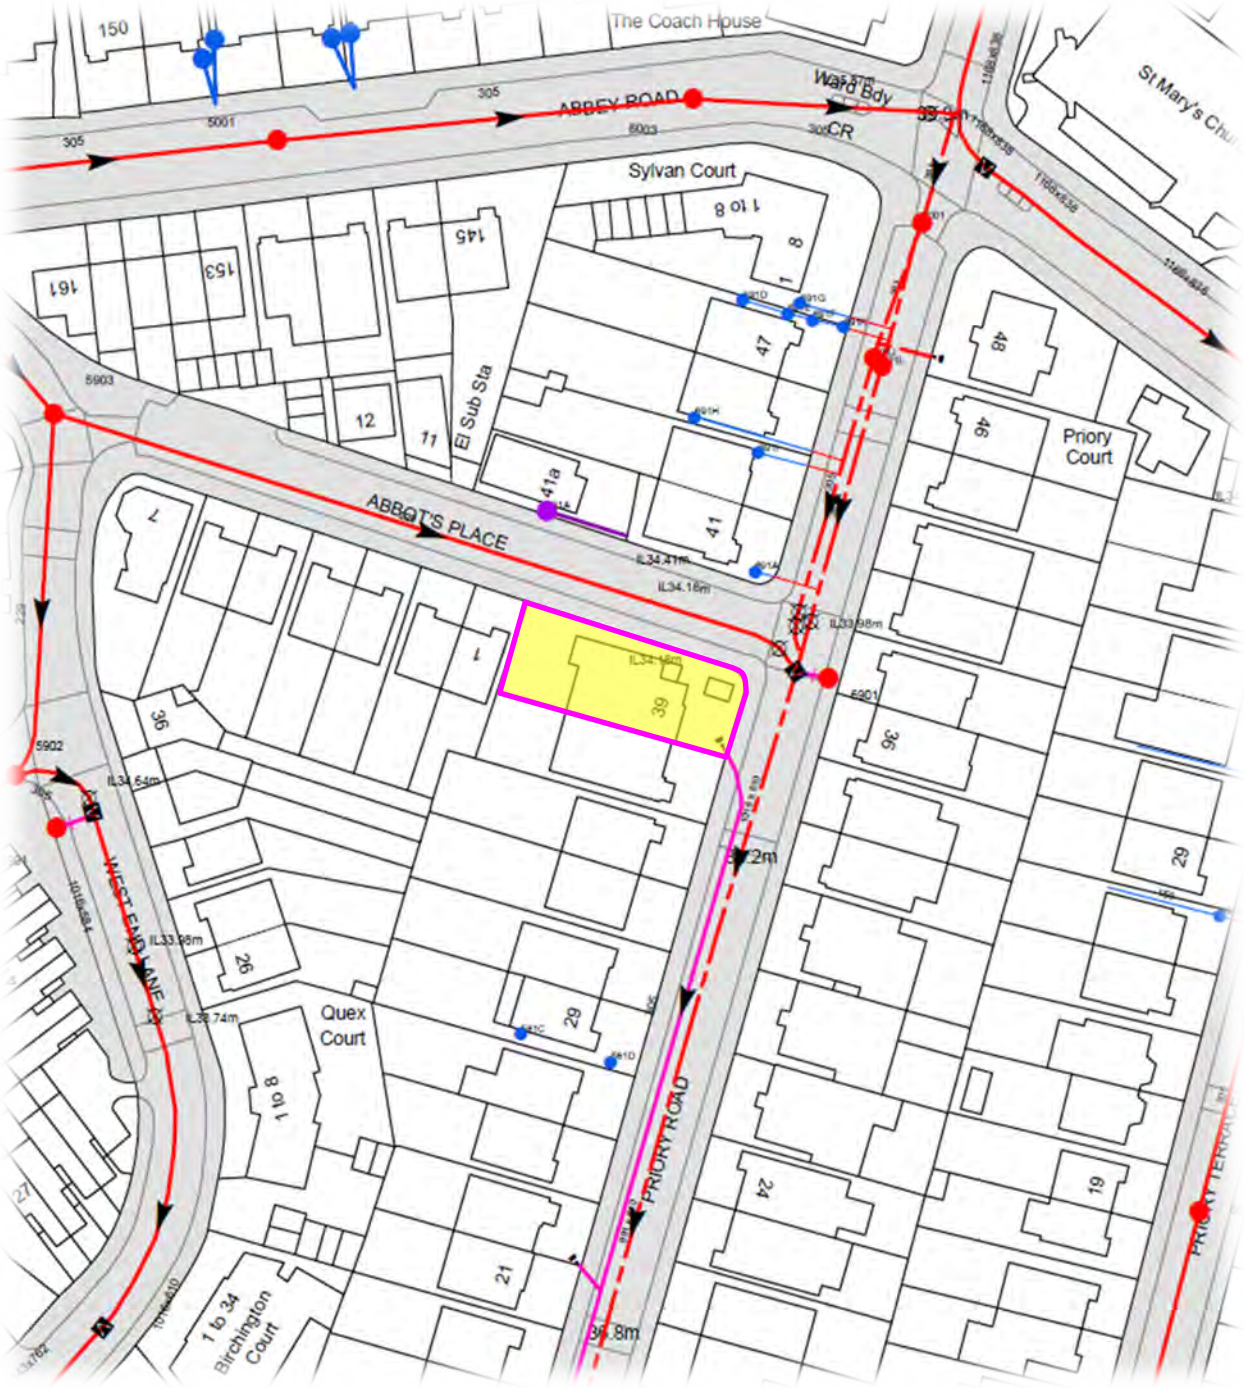
The property is mostly hard-surfaced and the surface water run-off collected on site is directed to a single manhole at the front, and then towards a 305mm diameter local combined sewer running southwards below Priory Road.

The entirety of the main building roof drains towards a manhole located in a small lightwell at the front of the property. The run-off from the rear part of the roof is routed (at roof level) around to the front and towards the same manhole.

The run-off from the garage extension is directed into a planter bordering the extension to the rear.

The run-off from the existing basement conservatory and the low level rear patio is directed towards a gully, which then connects with an internal manhole located below the conservatory, before being directed towards the manhole at the front of the site via a drain below the existing building.

The hard-surfaced areas of the rear garden appear to drain towards either landscaped borders or the central planter.



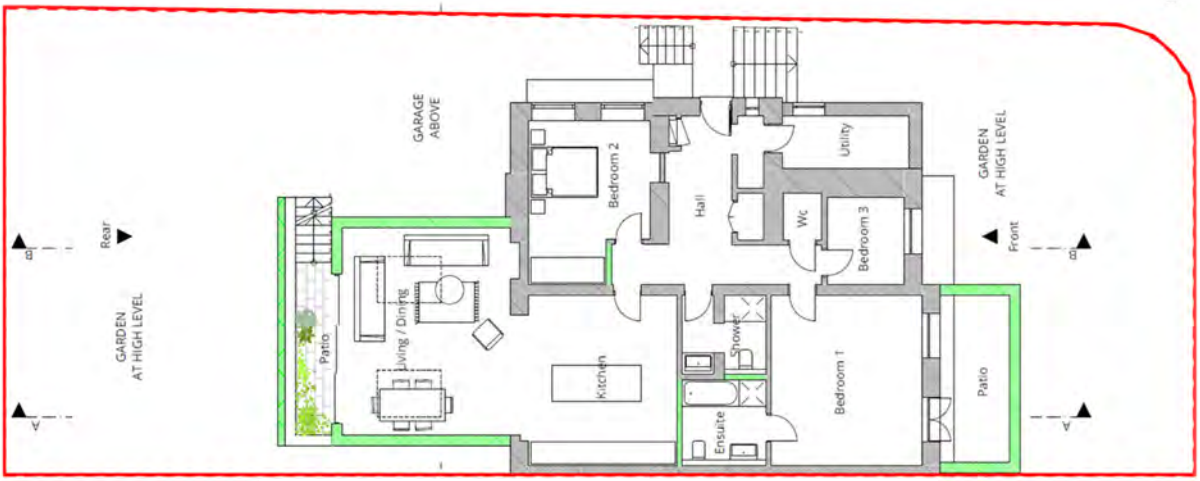
THAMES WATER SEWER NETWORK

3. PROPOSED DEVELOPMENT

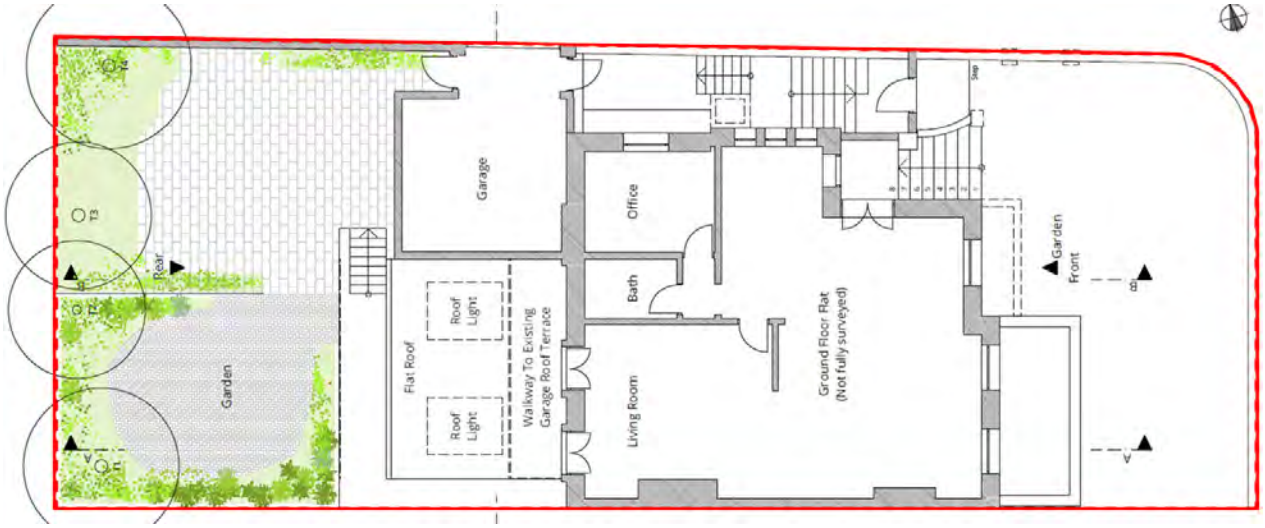
It is proposed to construct a new basement extension to replace the existing basement level conservatory together with a new basement level patio, which will extend further into the rear garden and provide a stepped access the garden.

At the front of the property, a new lightwell is proposed to be constructed, extending approx. 2m from the elevation and excavated to the existing basement level.

A reconfiguration of the rear garden / patio area is also proposed, including a slight net increase in the area of soft landscaping.



PROPOSED LOWER GROUND (BASEMENT) FLOOR



PROPOSED GROUND FLOOR

SCHEDULE OF ESTIMATED AREAS										
	EXISTING					PROPOSED				
		Cv	%		%	Proposed	Cv	%		%
FRONT AREAS	100sqm	0.77	23.5%			100sqm	0.77	23.5%		
BUILDING	180sqm	0.77	42.4%	**%IMP**	**87.1%**	193sqm	0.77	45.4%	**%IMP**	**84%**
REAR PATIOS	90sqm	0.77	21.2%			64sqm	0.77	15.1%		
GARDENS	55sqm	0.4	12.9%	**%PER**	**12.9%**	68sqm	0.4	16.0%	**%PER**	**16%**
TOTAL PROPERTY AREA	425sqm		100.0%		100.0%	425sqm		100.0%		100.0%

4. SURFACE WATER MANAGEMENT

4.1 SURFACE WATER MANAGEMENT (SWM) OBJECTIVES

The drainage strategy follows the guidance set out in the 2015 CIRIA C753 SuDS Manual; the principle of SuDS design is that surface water runoff is managed for maximum benefit. Biodiversity

4.2 SUDS DISCHARGE HIERACHY

The surface water runoff should be managed using the following techniques, as outlined in order of priority by the following drainage hierarchy:

SuDS Drainage Hierarchy	Suitable for the site? (Y/N)	Comment
Store rainwater for later use	Y	There is limited space for rainwater harvesting. Small water butts could be included.
Use infiltration techniques	N	The London Clay is unsuitable for soakaway infiltration.
Attenuate rainwater in ponds or open water features for gradual release	N	There is insufficient space to introduce open water garden features at this site.
Attenuate rainwater by storing in tanks or sealed water features for gradual release	Y	There is scope for attenuation storage within a cellular storage layer underlying the rear garden.
Discharge rainwater direct to a watercourse	N	There is no available watercourse.
Discharge rainwater to a surface water sewer/drain	N	There is no surface water sewer serving the site.
Discharge rainwater to the combined sewer	Y	The site discharges to the combined sewer beneath Priory Road.

The objective is to control the quantity of runoff to support the management of flood risk and maintain and protect the natural water cycle. The hierarchy seeks to ensure that surface water runoff is controlled as near to its source as possible to mimic natural drainage systems and retain water on or near to the site.

Before disposal of surface water to the public sewer is considered, all other options set out in the above hierarchy need to be exhausted.

4.3 FEASIBLE SUDS COMPONENTS

SUDS Component	Description	Suitable for the site? (Y/N)	Comment
Rainwater harvesting	Collection of rainwater runoff from roofs or impermeable areas for reuse.	Y	Water butts could potentially be included.
Green roofs	Vegetated areas installed on the top of buildings provide visual and ecological benefits in addition to surface water runoff reduction and enhanced building performance.	N	Although the new extension provides a flat roof area suitable for planting, this roof will replace the existing balcony terrace belonging to the ground floor flat and may not be available for planting.
Blue roofs	Roof design intended to store water providing attenuation storage.	N	The envisaged roof construction is not suitable for supporting the weight of attenuation storage.
Infiltration systems	Infiltration can contribute to reducing runoff rates and volumes while supporting base flow and groundwater recharge processes.	N	The London Clay is not suitable for infiltration.
Proprietary treatment systems	Proprietary treatment systems are manufactured products which remove specified pollutants from surface water runoff.	N	Not required.
Filter strips/drains	Filter strips are gently sloping strips of grass that provide treatment of runoff from adjacent impermeable areas. Filter drains are gravel or stone filled trenches which provide temporary subsurface storage for attenuation conveyance and filtration of surface water runoff.	N	There is insufficient space.
Swales	Swales are shallow, flat bottomed, vegetated open channels designed to convey, treat, and attenuate surface water runoff.	N	There is insufficient space.
Bioretention systems	Rain gardens or shallow landscaped depressions that may reduce surface water runoff rates and volumes and/or treat pollution using engineered soils and vegetation.	N	There is insufficient space for anything other than possibly some very small features within the rear garden.

Trees	Trees aid surface water management through transpiration, inception, infiltration and phytoremediation.	Y	There are existing trees and possibly some scope for additional planting to be introduced in the new soft landscaped areas in the rear garden.
Pervious Pavements	Pervious pavements facilitate the infiltration of surface water into a subsurface structure where filtration, adsorption, biodegradation or sedimentation may also provide treatment of the runoff.	Y	There is scope for permeable paving beneath the rear garden, in conjunction with attenuation storage beneath
Attenuation storage tanks	Attenuation storage tanks provide below-ground void space for the temporary storage of surface water before infiltration, controlled release or use.	Y	Attenuation storage tanks are feasible within the rear garden area.
Detention basins	Attenuation storage in the form of dry landscaped depressions.	N	Not possible.
Ponds and wetlands	Permanent water filled ponds or wetlands that provide attenuation storage or treatment of surface water runoff.	N	There is insufficient space.

4.4 BENEFITS

The types of benefits that may be achieved by utilising SuDS are categorised by the design objectives outlined in the following section.

4.4.1 WATER QUANTITY

The proposed changes to the rear garden provide opportunity to increase the soft landscaping cover of the site, which will in turn reduce the overall rainfall run-off.

Additionally, due to the above reworking of the rear patio of the site there is scope to reduce runoff rates and volumes through the inclusion of cellular attenuation storage. The latter can receive surface water directed from the building in addition to acting in combination with overlying pervious paving.

There may additionally be some limited opportunity to introduce rainwater harvesting.

The aim will be to achieve a minimum 50% betterment and as close to greenfield runoff rates as is possible.

4.4.2 WATER QUALITY

The water quality design objective is to manage the quality of runoff to prevent pollution, supporting the management of water quality in the receiving surface waters and groundwater and design system resilience to cope with future change.

The areas of planting and soft landscaping offer scope for filtering of the surface water.

4.4.3 AMENITY

The amenity design objective is to create and sustain better places for people by implementing the following criteria for the site:

- Maximise multi-functionality
- Enhance visual character
- Deliver safe surface water management systems
- Support development resilience/adaptability to future change
- Maximise legibility
- Support community environmental learning

The areas of planting and soft landscaping provide amenity value.

4.4.4 BIODIVERSITY

The biodiversity design objective is to create and sustain better places for nature by implementing the following criteria for the site:

- Support and protect natural local habitats and species
- Contribute to the delivery of local biodiversity objectives
- Contribute to habitat connectivity
- Create diverse, self-sustaining and resilient ecosystems.

The areas of planting and soft landscaping provide biodiversity value.

5. INITIAL DESIGN CONSIDERATIONS

An analysis has been undertaken of the pre- and post- development surface water run-off rates and volumes over a range of storm intensities and durations.

5.1 GREENFIELD RUNOFF RATE

The Greenfield runoff rates from the site have been calculated using the UK SuDS online tool and the Institute of Hydrology (IoH) 124 methodology.

Greenfield Rates:	
Qbar:	0.18 l/sec
1 in 1	0.15 l/sec
1 in 30	0.44 l/sec
1 in 100	0.58 l/sec
1 in 200	0.68 l/sec

5.2 EXISTING RUNOFF RATE

The site comprises a total area of approximately 425m^2 of which approx. 88% is impermeably surfaced. A basic SuDS feature in the form of a small rain garden is present at the rear elevation of the ground floor garage.

The existing peak storm runoff for the 1% (1 in 100 year) annual probability 15 min rainfall event on the site is estimated to be 11.0 l/sec. The calculation was based on the Wallingford Procedure and the resulting runoff was calculated using the Modified Rational Method with an M5-60 of 20mm, an 'r' value of 0.42 and a critical rainfall intensity of 99.3 mm/hr.

The rainfall runoff volume for the 1% (1 in 100 year) annual probability, 6 hour duration storm from the existing site is estimated to be 25.2 m^3.

6. PROPOSED SURFACE WATER DRAINAGE SCHEME

Attenuation storage is to be provided beneath the rear garden.

In ideal SuDS circumstances the runoff from the entire site would be directed towards the proposed attenuation storage, before discharging to the combined sewer. However, in this case, it is not possible to gain access to the roof and therefore the main roof drainage arrangement cannot be reconfigured.

However, while the existing surface water drainage system for the main roof will be maintained, all rainfall incident on the proposed rear extension and the rear patio area can be attenuated.

The volume of storage to be provided can be such that it would accommodate the theoretical storage required for achieving 50% betterment of the existing discharge from the whole site, (for the 1 in 100 year rainfall event in consideration of up to 40% climate change allowance).

These calculations indicate that some $9m^3$ of attenuation storage should be considered and this can be provided by 300mm deep cellular storage underlying $30m^2$ of permeable paving within the rear garden of the site.

The attenuated flow will then be directed towards the manhole at the front of the property and then on to the combined sewer beneath Priory Road.

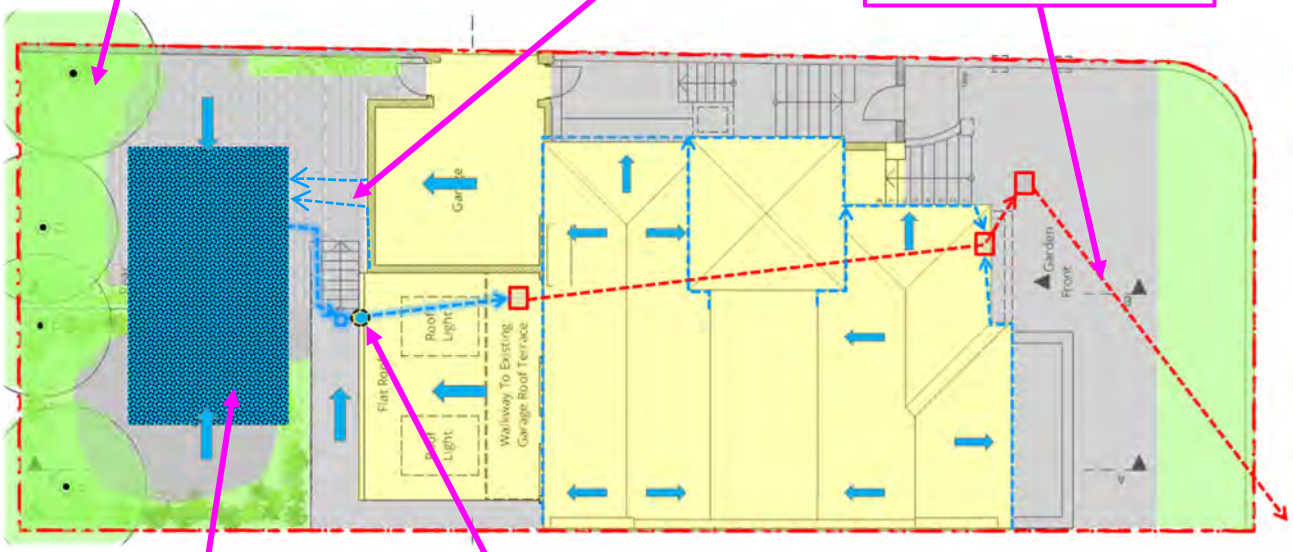
Not shown on plan:

- Possible small rain garden features in rear garden?
- Possible Rainwater Butts**?**

Additional areas of soft landscaping introduced in the rear garden, potentially also providing new planting on site

Discharge from garage and extension roofs to attenuation storage

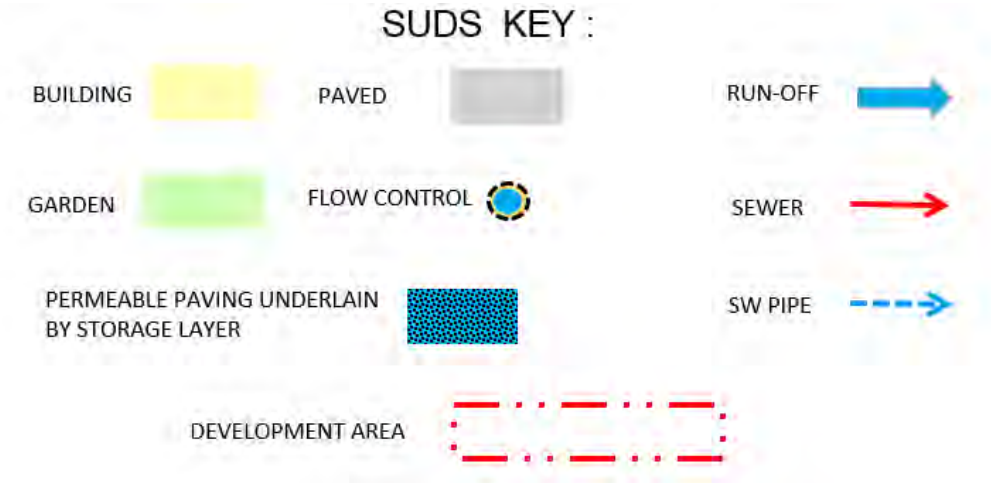
Final discharge to public combined sewer.



Cellular attenuation storage layer below permeable paving to 300mm depth, providing **approx. 9m^3 of storage**.

Discharge from attenuation via **orifice flow control**

Main building roofs drainage unchanged in comparison with the existing.



6.1 MAINTENANCE

There is a need to introduce arrangements for on-going SuDS maintenance over the lifetime of the development.

The proposed SuDS features will require some regular inspection and maintenance to clear any accumulated sediment or debris which may reduce the storage capacity as well as to ensure the inlets and outlets are clear and do not impede the water flow.

Maintenance activities can be broadly categorised as:

- Regular maintenance consists of inspections and basic tasks carried out to a frequent schedule (more frequently than once per year) including inspections, silt, litter or debris removal and vegetation management.

- Occasional maintenance comprises tasks that are required on a much less frequent and predictable basis (e.g. annual checks)

- Remedial maintenance describes the intermittent tasks that may be required to rectify faults associated with the system such as inlet and outlet repairs, infiltration surface rehabilitation, replacement of blocked filter materials/fabrics, system rehabilitation immediately following a pollution event.

7. CONCLUSION

This assessment has demonstrated that the developer has sought opportunities to reduce the overall level of flood risk through the appropriate application of sustainable drainage systems.

This assessment demonstrates that there is scope for various SuDS features that can restrain run-off, in accordance with Policy CC3 of the Camden Local Plan, to mitigate the risk of future surface water flooding, taking into account potential climate change.

APPENDIX

SUSTAINABLE DRAINAGE PRO-FORMA

PRELIMINARY DRAINAGE CALCULATIONS

1. Project & Site Details	Project / Site Name (including sub-catchment / stage / phase where appropriate)	39 PRIORY ROAD
	Address & post code	NW3 5HB
	OS Grid ref. (Easting, Northing)	E 525585
		N 183920
	LPA reference (if applicable)	
	Brief description of proposed work	Construction of a new rear basement extension as well as a front basement level lightwell.
	Total site Area for Attenuation	425 m^2
	Total existing impervious area	370 m^2
	Total proposed impervious area	357 m^2
	Is the site in a surface water flood risk catchment (ref. local Surface Water Management Plan)?	No
	Existing drainage connection type and location	Combined Sewer beneath Priory Road
	Designer Name	S R L B
	Designer Position	Principal
	Designer Company	LBHGEO

2. Proposed Discharge Arrangements

2a. Infiltration Feasibility

Superficial geology classification	N/A
Bedrock geology classification	London Clay
Site infiltration rate	1.E-09 m/s
Depth to groundwater level	No groundwater table present
Is infiltration feasible?	No

2b. Drainage Hierarchy

	Feasible (Y/N)	*Proposed (Y/N)*
1 store rainwater for later use	Y	Y
2 use infiltration techniques, such as porous surfaces in non-clay areas	N	N
3 attenuate rainwater in ponds or open water features for gradual release	N	N
4 attenuate rainwater by storing in tanks or sealed water features for gradual release	Y	Y
5 discharge rainwater direct to a watercourse	N	N
6 discharge rainwater to a surface water sewer/drain	N	N
7 discharge rainwater to the combined sewer.	Y	Y

2c. Proposed Discharge Details

Proposed discharge location	Combined Sewer beneath Priory Road
Has the owner/regulator of the discharge location been consulted?	No - as there will be a reduction in the volume and rate of water entering the TW sewer

3. Drainage Strategy

3a. Discharge Rates & Required Storage

	Greenfield (GF) runoff rate (l/s)	*Existing discharge rate (l/s)*	*Required storage for GF rate (m^3)*	*Proposed discharge rate (l/s)*
Qbar	0.18			
1 in 1	0.15	3.52	5.22	1.76
1 in 30	0.44	8.59	11.42	4.30
1 in 100	0.58	11.02	14.98	5.51
1 in 100 + CC			22.64	5.51
Climate change allowance used		40%		
3b. Principal Method of Flow Control		Orifice		

3c. Proposed SuDS Measures

	Catchment area (m^2)	*Plan area (m^2)*	*Storage vol. (m^3)*
Rainwater harvesting	0		0
Infiltration systems	0		0
Green roofs	0	0	0
Blue roofs	0	0	0

1 in 200	**0.68 l/sec**

National Non-Statutory Guidance:

For greenfield developments, the peak runoff rate from the development to any highway drain, sewer or surface water body for the 1 in 1 year rainfall event and the 1 in 100 year rainfall event should never exceed the peak greenfield runoff rate for the same event.

For developments which were previously developed, the peak runoff rate from the development to any drain, sewer or surface water body for the 1 in 1 year rainfall event and the 1 in 100 year rainfall event should be as close as reasonably practicable to the greenfield runoff rate from the development for the same rainfall event, but should never exceed the rate of discharge from the development prior to redevelopment for that event.

Where reasonably practicable, for greenfield development, the runoff volume from the development to any highway drain, sewer or surface water body in the 1 in 100 year, 6 hour rainfall event should never exceed the greenfield runoff volume for the same event.

Where reasonably practicable, for developments which have been previously developed, the runoff volume from the development to any highway drain, sewer or surface water body in the 1 in 100 year, 6 hour rainfall event must be constrained to a value as close as is reasonably practicable to the greenfield runoff volume for the same event, but should never exceed the runoff volume from the development site prior to redevelopment for that event.
