

Indicative image of window with warming filter applied

Example of general lighting without filter

Example of general lighting with filter

Indicative image for window filter, final filter specification to be selected with site mockups.

Window warming filters to be applied to all windows within the booking office facade. (Handsome Lobby and Platform façade), for consistent and uniform appearance.

Warming filters are required to reduce glare and impact of light spill from adjacent platform which uses a 4000K color temperature which is not suitable for a food and beverage environment and disturbing to clientele. The intention of the applied filter would also reduce UV impact and ageing of interior grade listed finishes.

Due to the higher lighting levels on the platform and Handsome lobby areas there will be minimum visual difference of the filtered windows compared to other windows in the same zones.

#### Window Treatment
