RSK Environment Limited (RSK) has prepared this report for the sole use of the client, showing reasonable skill and care, for the intended purposes as stated in the agreement under which this work was completed. The report may not be relied upon by any other party without the express agreement of the client and RSK. No other warranty, expressed or implied, is made as to the professional advice included in this report. Where any data supplied by the client or from other sources have been used, it has been assumed that the information is correct. No responsibility can be accepted by RSK for inaccuracies in the data supplied by any other party. The conclusions and recommendations in this report are based on the assumption that all relevant information has been supplied by those bodies from whom it was requested. No part of this report may be copied or duplicated without the express permission of RSK and the party for whom it was prepared. Where field investigations have been carried out, these have been restricted to a level of detail required to achieve the stated objectives of the work. This work has been undertaken in accordance with the quality management system of RSK Environment Ltd.

1 INTRODUCTION

1.1 Commissioning

RSK Environment Limited (RSK) was commissioned by Heyne Tillett Steel on behalf of Grange Hotels (the "Client") to carry out a geo-environmental site assessment of the land at the former Central St Martins site in Holborn, London. The project was carried out to an agreed brief as set out in RSK's proposal (372042 T01 (01), dated 26th November 2019.

This report is subject to the RSK service constraints given in Appendix A and limitations that may be described through this document.

1.2 Proposed development

The site in question is being considered for development for residential and commercial (hotel) use. The planned layout of the site is shown in the desk study report undertaken by A-squared Studio Engineers Limited included in Appendix C.

1.3 Objectives

The objective of the work is:

- to identify any land contamination and constraints to the proposed development and to support discharge of relevant planning conditions and relevant building control requirements;
- to identify the need for any additional investigation or remediation works to demonstrate that the site is suitable for its proposed use; and
- to evaluate potential client environment liabilities as part of the due diligence process for acquisition/ disposal.

1.4 Scope of works

The scope of this assessment has been developed in accordance with relevant British Standards and authoritative technical guidance as referenced through the report. The assessment of the contamination status of the site is in line with the technical approach presented in CLR 11 Model Procedures for the Management of Land Contamination (Environment Agency, 2004) and in general accordance with BS 10175: 2011 + A2 2017 (BSI, 2017). It is also compliant with relevant planning policy and guidance.

The scope of the intrusive investigation has been designed in line with the recommendations of BS5930: 2015 Code of practice for ground investigations (BSi, 2016), which maintains compliance with BS EN 1997-1 and 1997-2 and their related standards. It has also been developed in general accordance with BS 10175: 2011 + A2 2017. Ground gas assessment has been undertaken in general accordance with BS8756: 2013 and BS 8485:2015+A1:2019.

A brief summary of relevant legislation and policy relating to contaminated land is given in Appendix B.

The scope of works for the assessment has included the following:

- A review of the geotechnical and geo-environmental desk study report undertaken by A-Squared Studio Engineers Limited, Report Ref. 1129-A2S-XX-XX-RP-Y-0001-00, dated October 2019, and development of an outline conceptual site model;
- An intrusive investigation comprising 1 No. restricted access cable percussive borehole, 10 No. trial pit inspections, 8 No. dynamic sampler boreholes and 34mm diameter groundwater monitoring installations;
- Generic Quantitative Risk Assessment (GQRA) to assess complete pollutant linkages in order to refine to the outline conceptual model;
- A factual and interpretive report with recommendations for further works (i.e.
 undertake a remedial options appraisal to identify appropriate mitigation
 measures/produce a remedial implementation and verification plan) and/or
 remediation as necessary; and
- A preliminary assessment of the potential waste classification implications of soil arisings.

1.5 Existing reports

The following report was made available for review:

 A-squared Studio Engineers Limited, Geotechnical and Geo-environmental Desk Study Report, 1129-A2S-XX-XX-RP-Y-0001-00, October 2019

Pertinent information from these reports has been summarised in Section 2.

1.6 Limitations

The comments given in this report and the opinions expressed are based on the ground conditions encountered during the site work and on the results of tests made in the field and in the laboratory. However, there may be conditions pertaining to the site that have not been disclosed by the investigation and therefore could not be considered. It should be noted that there may be areas of made ground not detected due to the limited nature of the investigation or the thickness and quality of made ground across the site may be variable. In addition, groundwater levels may vary from those reported due to seasonal, or other, effects and the limitations stated in the data should be recognised.

Asbestos is often present in soils in discrete areas. Whilst asbestos-containing materials may not have been encountered during the fieldworks or supporting laboratory analysis, the history of the site indicates that asbestos may be present in soils and could be encountered during more extensive ground works.

2 SITE DETAILS

2.1 Site location

Site location details are presented in Table 1 and a site location plan is provided on Figure 1.

Table 1 Site location details

Site name	Grange Central Saint Martins
Full site address and postcode	Grange Central Saint Martins, Holborn, London, WC1B 4AF
National Grid reference (centre of site)	530503, 181651

2.2 Site description

The Site boundary and current site layout are shown on Figure 2. The Site covers an area of c. 0.50 hectares and is currently occupied by four existing structures: Lethaby Building, Red Lion Square, Cochrane Theatre, and Central St Martins Bridge Link and Innovation Centre. Lethaby Building is a five-storey grade II listed building, Red Lion Square is a thirteen-storey structure, Cochrane Theatre is a four-storey structure and the Central St Martins Bridge Link spans between the Lethaby and Red Lion Square. A one-level basement is present across all the structures.

There are currently no areas of soft landscaping located on the site.

2.3 Surrounding land uses

The Site is located in Holborn, London, within a predominantly residential and commercial setting. Immediate surrounding land uses are described in Table 2.

Table 2 Surrounding land uses

North	North The A40, with a hotel and other various office buildings etc. beyond.				
East	The A40, with Red Lion Gardens and other various office/retail buildings beyond.				
South	Fisher Street, with Lion Court beyond; a large building comprising offices and commercial/retail units.				
West	Southampton Row, with various office buildings and commercial/retail units beyond.				

2.4 Development plans

The proposed layout of the site, at the time of preparing this report, is shown in the desk study report undertaken by A-squared Studio Engineers Limited, which has been reproduced in Appendix C.

As per current understanding of the site, the proposed development is for the refurbishment of the existing Lethaby Building into a 105-room hotel.

The existing Red Lion Square and Central St Martins Bridge Link and Innovation Centre is to be refurbished and expanded in to a 7- to 14-storey hotel structure.

Finally, the Cochrane Theatre is to be replaced by a separate ten-storey residential structure in the north-eastern corner of the site.

The existing single-level basement underneath Red Lion Square, Cochrane Theatre and Central St Martins Bridge Link and Innovation Centre will be deepened into a three-level basement, while the existing single-level basement underneath Lethaby Building will remain unchanged.

There are no plans to incorporate any areas of soft landscaping.

3 DESK-BASED ASSESSMENT

A-squared Studio Engineer Limited carried out a geotechnical and geo-environmental desk study report in October 2019 (Ref. 1129-A2S-XX-XX-RP-Y-0001-00). A summary of the pertinent information from this report is presented in Table 3.

Table 3 Summary of A-squared Studio Engineer Limited report

Report Details	Desk Study Report of Grange Central St Martins				
Site coverage The report covers the full footprint of the site recognised with report which include the footprints of the Lethaby Building, Re Square, Cochrane Theatre, and Central St Martins Bridge Lin Innovation Centre.					
Summary scope of works	 The study was to provide preliminary recommendations regarding: Potential foundation design options; Basement retention considerations; The identification of geo-hazards that may affect design and construction operation; Identification of hazards and associated risk of potential ground contamination; and Recommendations for future ground investigations. 				
Proposed development	The Lethaby Building is to be refurbished into a 105-room hotel, the existing Red Lion Square and Central St Martins Bridge Link and Innovation Centre are to be refurbished and expanded in to a seven to fourteen storey hotel structure and the Cochrane Theatre is to be replaced by a separate ten-storey residential structure in the north-eastern corner of the site. The existing one-level basement underneath Red Lion Square, Cochrane Theatre and Central St Martins Bridge Link and Innovation Centre will be deepened into a three-level basement, while the existing one level basement underneath Lethaby Building will remain unchanged.				
Site history	 Key historical changes have been detailed below: 1851 – 1878 By the early 1870s the entire site had been developed and appeared to comprise unlabelled residential and commercial buildings. A blacking works was noted being 100m south-east of the site and a stone yard 250m south-west. 1895 – 1898 By 1896 the buildings within the south-eastern corner of the site had been replaced by a large church. A fire engine station was present within the north-eastern corner of the site. 				

	0	Tracks for a tramline was present 25m north-east.			
	 1908 - 	- 1920			
	0	By 1908 the buildings covering the eastern area of the			
		site was replaced with a school.			
		The south-western site corner was cleared and replaced			
	0				
		with a large building for the school.			
	0	The tramlines to the north-east had been extended along			
		Theobald's Road and a tram tunnel was opened in 1906			
		to the west.			
	0	The blacking works to the south-east was dismantled by			
	O	1910.			
	1034	- 1944			
		-			
	0	By the early 1940s, a large electrical substation was			
		shown to the immediate south of Fisher Street.			
	• 1952 ·	- 1954			
	0	By 1952 the entire eastern and south-eastern areas of			
		the site was demolished.			
	0	The school now extended to occupy the central and			
		western areas.			
		TI 6' ' ' ' ' ' ' ' ' ' ' ' ' ' ' ' ' ' '			
	0				
		- 1970			
	0	By the 1960s, the eastern are of the site was labelled as			
		Red Lion Square, Grange Street to north was removed			
		and Jeanetta Cochrane Theatre had replaced York			
		House.			
	0	A new building in the eastern area of the site was			
		labelled the Holborn College of Law.			
	0	By 1970, a sunk petrol tank was shown within an office			
	O				
		building 75m south-east of the site and the tram lines			
		were removed.			
	• 1972	- 1979			
	0	By 1979, an addition building was constructed to the			
		south of the site.			
	• 1982	- 2019			
	0	No major changes up to 1999			
	0	A 2009 building survey indicated the presence of several			
		tanks, boiler and plant rooms within the basement of the			
		original College building at the west and south of the site.			
		The Kingsway tram tunnel remains to the west of the site			
	0	•			
	The mustin	as Grade II listed.			
		ninary ground model as outlined by the report is as			
	follows:				
Made Ground ~ thickness of 3.00m					
Geology	_	Hill Gravels ~ thickness of 3.00m			
	 London Clay ~ thickness of 18.00m 				
	Lambeth Group ~ thickness of 19.00m				
	• Thane	et Sands ~ thickness of 10.50m			

	Chalk ~ thickness of >100m					
Hydrogeology	The groundwater model indicates the presence of a shallow water table within the Lynch Hill Gravels (classified as a Secondary A Aquifer) overlying the low permeability London Clay Formation. The historical data places this between $3.00-6.00$ mbgl within the Lynch Hill Gravels and above the London Clay Formation. The report states that groundwater is discontinuous / perched, in RSK's opinion the groundwater is likely to be a continuous body of water flowing towards the River Thames to the south/southeast.					
and hydrology	There are two Local Authority Pollution Prevention Controls (LAPPC) reported within a 400m radius of the site relating to dry cleaners.					
	The nearest surface water feature to the site was listed 859m to the east relating to the River Thames.					
	The site is located within an area with the potential for groundwater flooding of properties situated below ground level but the site itself is not listed as at risk of surface water flooding.					
Existing Underground Infrastructure	A Post Office tunnel, owned by Royal Mail, is present close to the northern boundary of the site approximately 20.00 – 23.00mbgl. The London Underground Piccadilly Line tunnels are present west of the site at unknown depths and the site falls within the London Underground zone of influence. Finally, Crossrail tunnels are present to the south of the site beneath Fisher Street running approximately 6.50mbgl.					
uxo	A detailed UXO Risk Assessment was carried out by a specialist contractor to assess the risk to the site and what, if any, mitigation measures would be required for any intrusive work. The report (1st Line Defence Report ref DA10449-00, dated 7th February 2020) stated the site is located in an area that sustained an overall very high density of bombing during WWII as represented by bomb density data figures and maps. The site was assessed to have an overall Medium Risk from German aerial delivered UXO in the south eastern section of the site and an assessed Low Risk in the western and northern sections of the site.					
	mitigation measures were adopted for any intrusive investigations within the Medium Risk area of the site.					

	The following linkages were noted:
Preliminary Contaminated Land Risk Assessment	 Made ground associated with the various phases of development, possible contains associated with former use of the site as a car park, fire station, school, theatre, possible storage of fuel for heating buildings. No linkages – as the site is covered in hardstanding prevent direct contact with the underlying made ground. Made ground will also be removed from a large portion of the site part of the propose to increase the depth of the basements. Off Site Various potentially contaminative activities surrounding the site including a sunk petrol tank, dry cleaners photo processers, blacking works, snuff and tabaco manufactory. Linkage 1 –Risk to future site users from Inhalation of site and windblown dust assessed as Low Risk. Linkage 2 – Risk to future site users and groundwater from Leaching and migration via groundwater assessed as Low Risk. Linkage 3 – Risk to future site users from migration of vapours on to the site from off-site sources via the groundwater, assessed as a Moderate Risk. The report stated that the most significant risk to futures site users was the potential for gas / and vapours from the made ground, and former fuel storage associated with the boiler room(s) on the site. However, it must be noted that the CSM indicates that the highest risk from vapours is from off-site sources.
Conclusion	The desk study concluded that an intrusive investigation to assess the risk to the site and confirm whether the potential linkages identified exist.

4 INITIAL CONCEPTUAL SITE MODEL

Due to inconsistencies within the conceptual site model within the desk study report, RSK have revised the initial model within the following sections along with justification for the changes.

4.1 Potential soil, ground gas, soil vapour and groundwater linkages

4.1.1 Potential sources of chemical and ground gas contamination

Potential sources of soil and groundwater contamination identified from current activities and the history of the site and surrounding area are presented in Table 4.

Table 4 Potential sources of soil and groundwater contamination

Potential sources	Contaminants of concern	Current or historical?
On-site		
Made ground (Due to the extensive historic construction on site including buildings, roads and bomb damage)	Unknown fill material but potentially including heavy metals, asbestos, hydrocarbons (PAHs and TPH), volatile and semi-volatile organic compounds (VOC and SVOC), BTEX, MTBE, acidity, inorganics, elevated sulphates, vapours, ground gases (methane, carbon dioxide and hydrocarbons), brick, ash and clinker. Made ground typically comprises construction type materials, and therefore unlikely to contain organic contaminants such as TPH etc unlikely impacted from another source / historical activity.	Historical
Presence of several underground tanks of unknown use and boiler and plant rooms within the basements.	Potential contaminants of concern include hydrocarbons (PAHs and TPH), volatile and semi volatile organic compounds (VOC and SVOC), BTEX, MTBE and hydrocarbon vapours. Former boilers may have been powered using heating oil. However, this contains mid to high range petroleum hydrocarbons. BTEX, MTBE, VOC and SVOC are therefore unlikely to be present.	Historical

Potential sources	Contaminants of concern	Current or historical?
Historical activities on site (schools, theatre, fire engine station, plumbers, shops, silk dressers, church, car park and a service yard)	Contaminants associated may include metals, inorganics, asbestos, hydrocarbons (PAHs and TPH), pH adjusters, phenols, VOC/SVOC, BTEX, MTBE, vapours.). MTBE is an additive for modern fuels and unlikely to be present on-site. There is no evidence to suggest that large quantities of solvents were stored / used on this site thereby reducing the potential for encountering VOC/SVOC.	Historical
	Off-site	
Former tramlines, electrical substation and sunk petrol tank (c.75m southeast) A blacking works (c.100m southeast) A small garage (c.100m east) A tobacco and snuff manufactory (c.200m southeast)	The potential contaminants from these sources include heavy metals, asbestos, hydrocarbons (PAHs and TPH), pH adjustors, PCBs, BTEX, acidity, VOC, SVOC, vapours and ground gases (methane and carbon dioxide). None of the identified sources as classified as potential sources of ground gas within the BS8485 'assessing risks posed from ground gases'.	Historical
Existing dry-cleaning premises (c.33m west)	Chlorinated solvents. The desk study states that this source would have a 'limited environmental impact due to modern environmental controls and permitting'. It is therefore considered that this source is unlikely to pose a significant risk to the development and can be discounted from the assessment.	Current/ historical

4.1.2 Sensitive receptors and linking exposure/ migration pathways

Sensitive receptors identified at or in the vicinity of the site that could be affected by the potential sources identified above comprise:

- current/ future site residential, commercial users (inhalation of ground gas and vapours from made ground / historical uses of the site);
- current/ future residential and commercial users (migration of organic contaminants in the groundwater beneath the site, inhalation by current / future site users);
- current/ future buildings and services (direct contact with contaminated soils or groundwater and chemical attack); and
- Controlled Waters: groundwater (leaching of contamination into underlying Lynch Hill Gravel Member Secondary A Aquifer).

Potential linking pathways are show in brackets for each item above.

The proposed development plans show that the site will be covered in hard standing. No areas of soft landscaping are proposed and therefore there is no linkage for future site users to come into direct contact with the underlying soils.

Please note that construction workers and future maintenance workers have not been identified in the conceptual model as receptors because risks are considered to be managed through health and safety procedures according to the CDM Regulations.

4.2 Preliminary risk assessment

The preliminary risk assessment findings and potentially complete contaminant linkages are shown in Table 5 overleaf. The risk classification based on the combination of hazard consequence and probability using a risk matrix from CIRIA C552 (Rudland et al., 2001), a summary of which is included in Appendix D.

Table 5 Risk estimation for potentially complete contaminant linkages

Potential source	Possible pathway	Potential receptors	Likelihood	Severity	Potential risk	Justification
On-site sources including	Inhalation of ground gas	Existing / future site users	Low	Medium	Moderate / Low	Made ground is likely to compose of inert construction type materials. Made ground with a low organic matter content is classified in BS8485 as having a very low gas generation potential. It is likely that made ground would have been removed during the construction of the existing basements, additional material will be removed where these are to be deepened.
made ground, potential asbestos containing material, historical tanks and services (e.g. fire engine station, plumbers, shops, silk dressers, church, car park and a service yard)	Inhalation of vapours	Existing / future site users	Low	Medium	Moderate / Low	Any organic contaminants from historical spillage / leaks are likely to have degraded over time. The highest risk is present within the area of the possible fuel storage in the boiler room. However, oils with a low volatility would have been used, and it is not certain whether there was ever a leak.
	Leaching into underlying groundwater	Secondary A Aquifer	Low	Mild	Low	Any historical leaks / spill are likely to have degraded over time, there is no continuing source of contamination. There are no groundwater abstractions from the underlying aquifer. Made ground will be removed where basement is to be extended. Hard cover will also reduce the potential for leaching.

Potential source	Possible pathway	Potential receptors	Likelihood	Severity	Potential risk	Justification
	Direct contact	Water supply pipes	Likely	Minor	Low	There are no active sources of organic contaminates that would pose a risk to water supply pipes. Any risks can be easily mitigated through use of barrier pipe.
Off-site historical sources including former tramlines, electrical substation, sunk petrol tank (c.75m south-east), blacking works (c.100m south-east), inactive photographic processors (c.80m south-east and 49m south-west).	Leaching organic contaminants into groundwater. Volatilisation of vapours into unsaturated zone and inhalation by current / future residents.	Current and future site users	Unlikely	Medium	Low	There are no active sources of off-site contamination. Organic contamination is likely to degrade over time. Groundwater direction is anticipated to be to the south / south east and therefore many of the sources are down-gradient of the site. The proposed basement will be waterproofed preventing ingress of gas / vapours.

		Consequences					
Risk matrix		Severe	Medium	Mild	Minor		
	Highly likely	Very high	High	Moderate	Moderate/low		
bility	Likely	High	Moderate	Moderate/low	Low		
Probability	Low likelihood	Moderate	Moderate/low	Low	Very low		
	Unlikely	Moderate/low	Low	Very low	Very low		

.

Based on the above assessment the following linkages were considered to have a moderate to low risk:

 Potential risk to future site users from ground gas and hydrocarbon vapours from made ground and historical activities carried out on the site.

5 SITE INVESTIGATION STRATEGY & METHODOLOGY

5.1 Introduction

RSK carried out intrusive investigation works and subsequent monitoring of boreholes between 18th February 2020 and 27th February 2020 with a return visit to site on the 23rd April 2020 to undertake a single cable percussive borehole.

5.2 Objectives

The specific objectives of the investigation were as follows:

- to characterise the ground conditions underlying the site including the extent and thickness of any made ground;
- to determine groundwater depth and flow direction; and
- to assess geotechnical properties of soils.

5.3 Selection of investigation methods

The techniques adopted for the investigation were chosen with consideration of the objectives and site constraints, which are described below.

Dynamic sampler boreholes were chosen to achieve a greater visibility of the made ground as well as the opportunity to undertake in situ geotechnical testing, collect disturbed samples and install groundwater monitoring wells.

The boreholes were undertaken through the base of various open trial pits, which had been excavated by others prior to RSK attending site.

5.4 Investigation strategy

The ground investigation was carried out using intrusive ground investigation techniques in general accordance with the recommendations of BS5930: 2015 Code of practice for ground investigations, which maintains compliance with BS EN 1997-1 and 1997-2 and their related standards. Whilst every attempt was made to record full details of the strata encountered in the boreholes, techniques of hole formation and sampling will inevitably lead to disturbance, mixing or loss of material in some soils and rocks.

The constraints to the investigation were as follows:

Due to the restricted access and space at the majority of the exploratory locations, a
restricted access cable percussive drilling rig and modular dynamic sampling rig were
utilised with two locations being undertaken using hand-held equipment.

Details of the investigation locations, installations and rationale are presented in Table 6.

Table 6 Exploratory hole and monitoring well location rationale

Investigation Type	Number	Designation	Monitoring well installation	Rationale Examples below
Boreholes by dynamic sampling methods	8	BH1, WS1 to WS8	50mm and 34mm groundwater monitoring installations within BH1, WS2, WS4 and WS8.	To determine the geological succession beneath the site, determine the contamination status and to install gas and groundwater monitoring wells
Trial-pit inspections excavated by others	10	TP1 to TP7, TP9, TP11 and TP12	n/a	To provide further coverage of the geology beneath the site and obtain samples for laboratory testing.
Trial-pit inspections excavated by others	2	TP13 and TP14	34mm groundwater monitoring installations	To install groundwater monitoring wells

5.4.1 Implementation of investigation works

The exploratory holes were logged by an engineer in general accordance with the recommendations of BS 5930:2015 (which incorporates the requirements of BS EN ISO 14688-1, 14688-2 and 14689-1).

The monitoring well construction and associated response zones are detailed on the exploratory hole records in Appendix E.

The soil sampling and analysis strategy was designed to characterise each encountered soil strata, permit an assessment of the potential contaminant linkages identified and investigate the geotechnical characteristics. In addition, samples were taken to allow for geo-environmental and geotechnical testing to be undertaken.

Soils collected for laboratory analysis were placed in a variety of containers appropriate to the anticipated testing suite required. They were dispatched to the laboratory in cool boxes under chain of custody documentation. Samples were stored in accordance with the RSK quality procedures to maintain sample integrity and preservation and to minimise the chance of cross contamination.

Selected samples were placed in polythene bags for headspace screening with a photoionisation detector (PID) fitted with a 10.6 eV bulb. The PID screening results are presented on the exploratory hole records.

5.5 Monitoring programme

5.5.1 Groundwater monitoring and sampling

Four rounds of groundwater monitoring were undertaken over a period of a month. The monitoring records, including dates, are shown in Appendix F.

Depths to groundwater were recorded using an electronic dip meter on each of the return monitoring visits.

5.5.2 Ground gas monitoring

In line with the conceptual model, which indicated soil gas sources on site and in the surrounding area, response zones were installed to target the sources or pathways as detailed in the desk study.

A total of two monitoring rounds have been undertaken to date to provide data to support the conceptual model.

An infrared gas meter was used to measure gas flow, concentrations of carbon dioxide (CO_2) , methane (CH_4) and oxygen (O_2) in percentage by volume, while hydrogen sulphide (H_2S) and carbon monoxide (CO) were recorded in parts per million. Initial and steady state concentrations were recorded. In addition, during the first monitoring round, all wells were screened with a PID to establish if there are any interferences and cross-sensitivity of other hydrocarbons with the infrared gas meter.

The atmospheric pressure during monitoring, along with the weather conditions, was recorded.

5.6 Laboratory testing

Laboratory testing was undertaken at a UKAS accredited laboratory with ISO17025 and MCERTS accredited test methods were specified where applicable for contamination testing and as shown in the laboratory test certificates appended.

5.6.1 Chemical analysis of soil samples

The soil testing strategy was designed to characterise made ground with regards to waste disposal only.

A total of 3 samples were taken and are recorded together with their depths on the exploratory hole records in Appendix F. The samples were transported to the laboratory in chilled cool boxes. Laboratory chain of custody forms can be provided if required.

It should be noted that one sample (TP12 0.4 m) was reported to exceed its holding time for analysis for total PAHs, total BTEX, Extractable Petroleum Hydrocarbons (EPH), Volatile Petroleum Hydrocarbons (VPH), where scheduled. It is noted that this was due to samples being received at the laboratory 18 days following collection on site. As only one sample was affected and the results from these samples were consistent with others that did not exceed the holding time this is considered unlikely to adversely impact the investigation findings.

The programme of chemical tests undertaken on soil samples obtained from the intrusive investigation is presented in Table 7 with the laboratory testing results contained in Appendix G.

Table 7 Summary of chemical testing of soil samples

Stratum	Tests undertaken	No. of tests
	Metals suite (As, Cd, Cr, Cu, Hg, Pb, Ni, Se, Zn) and pH	3
	Moisture content	3
	Speciated Polycyclic Aromatic Hydrocarbons (PAHs)	3
Made ground	Coronene	3
	TPH CWG plus BTEX and MTBE	3
	Asbestos screen	3
	Waste Acceptance Criteria (WAC)	3

5.6.2 Chemical analysis of water samples

The soil testing strategy was designed to characterise made ground with regards to waste disposal only.

The programme of chemical tests undertaken on soil samples obtained from the intrusive investigation is presented in Table 7 with the laboratory testing results contained in Appendix G.

Table 8 Summary of chemical testing of soil samples

Stratum	Tests undertaken	No. of tests
	Metals suite (As, Cd, Cr, Cu, Hg, Pb, Ni, Se, Zn) and pH	2
	Water Soluble Sulphates	2
Lynch Hill Gravel	Speciated Polycyclic Aromatic Hydrocarbons (PAHs)	2
	Volatile Organic Compounds	2
	TPH CWG plus BTEX and MTBE	2

5.6.3 Geotechnical analysis of soils

Where appropriate disturbed soil samples were taken for geotechnical classification testing with the depth and nature of samples detailed within the exploratory hole records.

Where appropriate, testing was undertaken in accordance with BS 1377:1990 Method of Tests for Soils for Civil Engineering Purposes or, where superseded, by the relevant part of BS EN ISO 17892:2014 Geotechnical investigation and testing - Laboratory Testing of Soil.

The programme of geotechnical tests undertaken on samples obtained from the intrusive investigation is presented in Table 9. The results and UKAS accreditation of tests methods are shown in Appendix H.

Table 9 Summary of geotechnical testing undertaken

Strata	Tests undertaken	No. of tests
Made ground		0
Lynch Hill Gravel Member	Particle size distribution	8

5.6.4 Infiltration testing

Infiltration tests were carried out in installations within WS1, WS4 and TP7 to establish an indicative infiltration rate of the Lynch Hill Gravel Member. This involved filling the installation present with water and recording the reduction in water level with time as the water drained away into the surrounding soils.

Copies of the testing records are included in Appendix E. It should be highlighted that indicative results for WS4 and TP7 only are present as the infiltration rates exhibited within WS1 did not permit the filling of the installation to a satisfactory level to start recording any infiltration.

6 SITE INVESTIGATION FACTUAL FINDINGS

The results of the intrusive investigation and subsequent geo-environmental and geotechnical laboratory analysis undertaken are detailed below.

6.1 Ground conditions encountered

The descriptions of the strata encountered, notes regarding visual or olfactory evidence of contamination, list of samples taken, field observations of soil and groundwater, in-situ testing and details of monitoring well installations are included on the exploratory hole records presented in Appendix E.

The exploratory holes revealed that the site is underlain by a variable thickness of made ground over Lynch Hill Gravel Member. This appears to confirm the stratigraphical succession of the published geological records.

For the purpose of discussion, the ground conditions encountered during the fieldworks are summarised in Table 10 with the strata discussed in subsequent subsections.

Table 10 General succession of strata encountered

Stratum	Exploratory holes encountered	Depth to top of stratum m bgl	Proven thickness (m)			
Made ground	All locations	0.00 (Ground level)	0.15 - 1.70			
Lynch Hill Gravel Member	All locations except TP3 and TP6	0.15	4.60*			
London Clay Formation	BH1	4.60	>10.40			
Notes: *Accurate thickness indeterminable due to initial pitting works being undertaken by others.						

6.1.1 Made ground

The made ground generally comprised a concrete slab or paving slabs overlying granular deposits below with thicknesses ranging from 0.15m to 1.70m. The granular made ground soil generally comprised orangish brown medium to coarse sand with angular to subrounded fine to coarse gravel of brick, flint and rare clinker. A limited thickness of made ground was encountered across the majority of the exploratory hole locations within the footprint of the Lethaby Building, except TP6. It is noted that this location appears to comprise reworked natural deposits backfilled above the shallow spread foundation following former construction.

6.1.2 Lynch Hill Gravel Member

This stratum was underlying the made ground with top depths between 0.15m and 1.70m below ground level, however, its base was not proven by the investigation. Based on the site descriptions and laboratory and in-situ tests carried out this layer can be described as a very dense granular soil. It comprised very dense orangish brown and brown fine to coarse sandy angular to rounded fine to coarse gravel of flint.

A summary of the in-situ test results recorded in the stratum are presented in Table 11.

Table 11 Summary of in-situ and laboratory test results for granular unit

Soil parameters	Value	Reference
SPT 'N' values	>50	Appendix E
Density term	Very Dense	Appendix E

6.1.3 London Clay Formation

This stratum was underlying the Lynch Hill Gravel Member at 4.60m below ground level, however, its base was not proven by the investigation. Based on the site descriptions and in-situ tests carried out this layer can be described as a stiff to very stiff closely fissured dark grey clay.

A summary of the in-situ test results recorded in the stratum are presented in Table 12.

Table 12 Summary of in-situ and laboratory test results for granular unit

Soil parameters	Value	Reference
SPT 'N' values	14 to 29	Appendix E
Consistency term	Stiff to very stiff	Appendix E

6.1.4 Visual/olfactory evidence of soil contamination

No visual or olfactory evidence of soil contamination was encountered during the intrusive investigation.

PID tests on collected soil samples were carried out in all trial pits with the exception of TP12. The results show 0.0ppm for every sample tested.

6.2 Groundwater

6.2.1 Groundwater encountered during intrusive works

Groundwater was encountered at 2.30m depth in two of the window sample holes WS1 and WS8 during the intrusive investigation works as detailed on the logs in Appendix E.

6.2.2 Groundwater encountered during monitoring

Rest groundwater levels recorded during the monitoring programme are summarised in Table 13 based on the data provided in Appendix F. Field data measurements are also shown in Appendix E.

Table 13 Groundwater monitoring data

Locations	10/03/20 17/03/20		01/04/20	07/04/20	
	Depth (m)	Depth (m)	Depth (m)	Depth (m)	
WS2	Dry	Dry			

Locations	10/03/20	17/03/20	01/04/20	07/04/20			
Locations	Depth (m)	Depth (m)	Depth (m)	Depth (m)			
WS4	Dry	2.46*	Dry	Dry			
WS8	Dry	Dry	Dry	Dry			
TP13	-	3.32	3.36	3.37			
TP14	-	3.26	3.31	3.33			
Notes: *Assumed to be perched.							

Two further trial pits were undertaken by the contractors on site following RSK's intrusive works. The depths to groundwater within these two pits, recorded on 17th March 2020, were 3.26mbgl and 3.37mbgl.

The findings reflect the groundwater table in the Lynch Hill Gravel Member, which is at a depth of between 3.26 and 3.37 m below ground level.

It should be noted that groundwater levels might fluctuate for a number of reasons including seasonal variations. On-going monitoring would be required to establish both the full range of conditions and any trends in groundwater levels.

6.3 Chemical laboratory results

The soil testing results are presented in Appendix G.

6.4 Geotechnical laboratory results

The results of the geotechnical testing are discussed in Section 11 and presented in Appendix H.

6.5 Ground gas monitoring

The results of the ground gas monitoring and testing carried out are given in Appendix F and discussed in Section 7.2.

PID tests within each well revealed results below <1.0pppm across all of the monitoring rounds.

7 GEO-ENVIRONMENTAL ASSESSMENT

7.1 Refinement of initial CSM

The exploratory holes confirmed the site is underlain by a varying thickness of made ground overlying the Lynch Hill Gravel Member with the London Clay Formation at depth.

Whilst a persistent groundwater table was not encountered during the intrusive investigation, the post site work monitoring visits, undertaken between March and April 2020, has indicated the presence of a groundwater table at a depth of around 3.26 to 3.32 mbgl.

No visual or olfactory evidence of significant soil or groundwater contamination was encountered at any of the exploratory positions.

In the absence of any identifiable pollutant linkages highlighted at the preliminary conceptual site model stage no further assessment is deemed to be required.

Notwithstanding the above it should be highlighted that although deposits of made ground were identified on site those materials were primarily located within the footprint of the proposed basement excavation. It is understood that, as part of the basement construction works, a secant pile wall will be installed and permeation grouting undertaken to form a watertight seal around the proposed basement excavation. Once dewatered all of the made ground soils will be effectively excavated and removed from site.

Those limited made ground deposits observed within TP6 will remain encapsulated beneath the concrete hardstanding that effectively covers the entire site outside of the proposed basement footprint.

7.2 Linkages for assessment

In line with CLR11 (Environment Agency, 2004), there are two stages of quantitative risk assessment, generic (GQRA) and detailed (DQRA). The GQRA comprises the comparison of soil, groundwater, soil gas and ground gas results with generic assessment criteria (GAC) that are appropriate to the linkage being assessed. This comparison can be undertaken directly against the laboratory results or following statistical analysis depending upon the sampling procedure that was adopted.

Following the refinement of the initial CSM, the potentially complete contaminant linkages that require further assessment and the methodology of assessment are presented in Table 14.

Table 14 Linkages for GQRA

Potentially relevant contaminant linkage	Assessment method
Ground Gas	
1. Concentrations of methane and carbon dioxide in ground gas entering and accumulating in enclosed spaces or small rooms in new buildings, which could affect future site users. For methane this could create a potentially explosive atmosphere, while death by asphyxiation could result from carbon dioxide.	Gas screening values (GSV) have been calculated using maximum methane and carbon dioxide concentrations with maximum flow rates recorded at the site. The GSV have been compared with the revised Wilson and Card classification presented in BS8485.

7.2.1 Oral, dermal and inhalation exposure with impacted soil by future site users

Despite the proposed development plans being likely to involve the removal of the made ground soils within the footprint of the proposed basement whilst leaving those existing areas and any proposed areas entirely covered with hardstanding, for completeness, the soil results have been compared against the appropriate GAC for a residential without plant uptake end-use.

From the comparison of the results from the non – targeted positions, it is noted that there are exceedances of lead, arsenic and elemental mercury (in the absence of a breakdown of the total) within a TP3 at 1.50m. Within TP4 at 0.50m and TP12 at 0.40m both samples exhibited elevated concentrations of total chromium over and above the hexavalent threshold. Further testing would be required to confirm whether this is a true reflection of the hexavalent levels on site.

Notwithstanding the above exceedances, as noted previously, given the proposed basement deepening will remove all sources of made ground from the site and given that any areas of the site will remain covered in concrete hardstanding the pollutant linkage between the made ground and future site users is absent.

No other determinants were encountered over and above the prescribed GACs for a residential without plant uptake end-use.

7.2.2 Inhalation exposure of future occupants/site users to asbestos fibres

The visual inspection at the laboratory identified no materials suspected of potentially containing asbestos and the scheduled laboratory screening for asbestos found no detectable asbestos fibres within the samples of made ground.

Whilst not detected during these works, it should be appreciated that asbestos is often present in discrete areas and may therefore be found during more extensive groundworks. Groundworkers should be made aware of the potential for it to be present in the made ground soils and should have asbestos awareness training. The potential presence of asbestos in the made ground should be addressed in the contractor's risk assessments and method statements.

7.2.3 Leaching of contaminants to groundwater in secondary aquifer and subsequent migration to surface watercourse

The presence of contaminants including metals have been identified in soils. It is noted however that most elevated constituents in soil are considered to be of typically low mobility in soil and groundwater. Chemical laboratory analysis of groundwater samples taken from TP13 and TP14 (screened in the Lynch Hill Gravels) have been compared against controlled water standards with all criteria either below the GAC or where GAC have been exceeded below the laboratory detection limit.

Based on the proposed development covering the majority of the site with impermeable hardstanding or new buildings, further infiltration to groundwater would be significantly limited and therefore leaching of mobile contamination, if present would be reduced.

Concentrations of TPHs, VOCs and all PAH's except for Pyrene within TP13 (0.03 μ g/l) were recorded below laboratory detection limits.

7.3 Ground gas risk assessment

7.3.1 Appropriate guidance

The risks to development from ground gases have been assessed in accordance with BS8485:2015, which provides guidance on ground gas (methane and carbon dioxide) characterisation and hazard assessment, as well as a framework for the prescription of protection measures within new buildings.

The process involves characterising the gas hazard from combining the qualitative assessment of risk (using the conceptual site model) with ground investigation data so that a 'characteristic situation' (CS) can be derived for the site. Characteristic situations range from CS1 to CS6, the higher the CS the higher the hazard potential. Protection measures within new buildings can be prescribed using a point scoring system, taking in to consideration the CS and the proposed building type.

BS8485 indicates that the gas hazard can be characterised using the following methods:

- an empirical semi-quantitative approach using gas monitoring data to determine the 'characteristic situation' of the site (or zones of the site) and subsequent protective measures (Wilson and Card approach);
- an empirical semi-quantitative approach using TOC data to determine the 'characteristic situation' of the site (or zones of the site) and subsequent protective measures (CL:AIRE RB17 approach); or
- detailed quantitative assessment methodologies.

For the purpose of this assessment, the first approach listed above has been used to characterise the gas hazard and provide advice on the protective measures likely to be required within new buildings at the site.

7.3.2 Summary of the refined conceptual site model for ground gas

In the assessment of risks and selection of appropriate mitigation measures, BS8485 highlights the importance of the conceptual model. In summary, potential sources of ground gas within influencing distance of the site identified in Section 6.2 comprises only

a limited thickness of made ground soils with a low organic content, which the ground investigation confirmed as being likely to have a 'very low' generation potential.

Pathways and receptors for ground gas were identified in Section 6.2.

This assessment has been undertaken to assess risks to building structures and proposed end users. The assessment has not taken into consideration the health and safety of construction workers. Risks may still be present to construction workers especially where works include the entry into excavations within the ground. Construction workers should undertake appropriate risk assessments and risks should be managed through health and safety procedures and safe systems of work.

The risk assessment has been undertaken based on the current understanding of the CSM.

7.3.3 Empirical semi-quantitative approach using borehole monitoring data (Wilson and Card approach)

The empirical semi quantitative approach using gas monitoring data is based on calculations of the gas screening value (GSV). BS8485 defines the GSV as the 'flow rate (I/hr) of a specific hazardous gas representative of a site or zone, derived from assessment of borehole concentration and flow rate measurements and taking account of all other influencing factors, in accordance with a conceptual site model'.

Once derived for both methane and carbon dioxide the GSVs are compared to the thresholds presented in Table 2 of BS8485, so that a CS can be determined for the site, or a zone. It is important to note that the GSV thresholds are guideline values and not absolute. The GSV thresholds may be exceeded in certain circumstances, if the site conceptual model indicates it is safe to do so. Similarly, consideration of additional factors such as very high concentrations of methane, should lead to consideration of the need to adopt a higher risk classification than the GSV threshold indicates.

The results of the ground gas monitoring and testing undertaken at the site are given in **Appendix F**.

The maximum results recorded are presented in Table 15.

Table 15 Summary of ground gas monitoring results

Borehole	Response zone/ stratum	Probable source(s) of ground gas	Number of visits	Methane (%)	Carbon dioxide (%)	Oxygen (%)	Flow rate (I/hr)	Water level (m bgl)	Atmospheric pressure (mbar)
WS4	MG	MG	2	<0.1	0.1	20.7 to 20.8	<0.1	Dry	1022 to 1028
WS8	MG	MG	2	<0.1	0.4	20.8 to 21.0	-0.1	Dry	1022 to 1029

Borehole	Response zone/ stratum	Probable source(s) of ground gas	Number of visits	Methane (%)	Carbon dioxide (%)	Oxygen (%)	Flow rate (I/hr)	Water level (m bgl)	Atmospheric pressure (mbar)
TP13	MG	MG	2	<0.1	0.1	20.7 to 21.0	<0.1	3.36 to 3.37	1022 to 1028
TP14	MG	MG	2	<0.1	<0.1	20.7 to 21.0	<0.1	3.31 to	1022 to 1028

Note: MG - Made Ground

Maximum concentrations and flows are presented in this table except for oxygen, where the minimum value is presented

BS8485 suggests that the GSV should be derived by multiplying the worse credible (worst case) recorded flow value in any standpipe in that strata or zone with the maximum gas concentration in any other standpipe in that strata or zone. Further guidance is given in BS8485 section 6.3.

The gas monitoring data obtained from the monitoring visits have been considered and have identified a maximum steady state methane concentration of <0.1% and a maximum steady state concentration of carbon dioxide of 1.0%.

- methane GSV (<0.0001 l/hr) = methane concentration (<0.1 % v/v)/100 x flow rate (<0.1 l/hr).
- Carbon Dioxide GSV (<0.0001 l/hr) = carbon dioxide concentration (0.4 % v/v)/100 x flow rate (<0.1 l/hr).

Based on the GSVs derived and the method for determining the CS presented within Table 2 of BS8485, the site has been characterised as 'Characteristic Situation 1' (CS1), for which no ground gas protection measures are considered necessary within proposed buildings.

8 PRELIMINARY WASTE ASSESSMENT

In accordance with the definition provided in the Waste Framework Directive (WFD), materials are only considered waste if 'they are discarded, intended to be discarded or required to be discarded, by the holder'. Naturally occurring soils are not considered waste if reused on the site of origin for the purposes of development. Soils such as made ground that are not of clean and natural origin (irrespective of whether they are contaminated or not) and other materials such as recycled aggregate, do not become waste until the criteria above are met. Further background information is provided in Appendix D.

Excavation arisings from the development may therefore be classified as waste if surplus to requirements or unsuitable for reuse. The following assessments assume the material tested is classified subsequently as waste.

RSK recommends that a Sampling Plan be prepared to support any waste classifications and hazardous waste assessments, prior to any material being excavated. Given the level of data obtained, scale of the development and heterogeneity of the site soils, the following assessment should be considered indicative and further assessment should be undertaken following the preparation of a waste sampling plan.

8.1 Hazardous waste assessment

Technical Guidance WM3 (EA, 2018) sets out in Appendix D requirements for waste sampling. It is a legal requirement to correctly assess and classify waste. The level of sampling should be proportionate to the volume of waste and its heterogeneity. The preliminary assessment provided below is based only upon the available sample results and may not be sufficient to adequately classify the waste.

8.1.1 Chemical contaminants

Envirolab, an RSK company, has developed a waste soils characterisation assessment tool (HASWASTE), which follows the guidance within Technical Guidance WM3. The analytical results have been assessed using this tool to assess the hazardous properties to support potential off-site disposal of materials in the future. Note that it is ultimately for landfills to confirm what wastes they are able to accept within the constraints of their permit.

The results are summarised in Table 16 and presented in full in Appendix I.

Table 16 Results of waste soils characterisation assessment (HASWASTE)

Sample ref/ depth	Hazardous properties identified
TP3 @ 1.50m	Hazardous – Carcinogenic HP7 & Toxic for Reproduction HP10
TP4 @ 0.50m	Not hazardous
TP12 @ 0.40m	Not hazardous

The sample of made ground from TP3 at 1.50m has been classified as potentially Hazardous waste based on the observed elevated concentrations of Lead. This elevated

concentration has exceeded the threshold values of 0.1% for HP7 and 0.3% for HP10 with a value of 0.3496%.

WAC testing would be required in order to further classify the materials into Hazardous/stable non-reactive or Non-hazardous/inert materials.

Prospective landfill operatives should be contacted at an early stage to discuss the waste classification of any material destined for off-site disposal and requirements for additional testing.

8.2 WAC assessment

All Inert, stable non-reactive Hazardous and Hazardous wastes have limit values (waste acceptance criteria) set out in legislation that must be met before that class of landfill can accept the waste. Currently, no WAC are in place for Non-hazardous waste.

Soil and other materials that are found not to be Hazardous may be classed as either Non-hazardous or Inert. In order to determine whether they can be classed as Inert the soil must be tested and found to be below the Inert waste acceptance criteria.

Samples TP3 at 1.5m, TP4 at 0.40m and TP12 at 0.65m were submitted for waste acceptance criteria (WAC) testing for Full 1 Batch waste suite, the results of which are presented in Appendix G.

The results of the WAC testing for the sample at TP3 indicates that the leaching limit values for copper, mercury and lead exceed the threshold values for inert and non-hazardous waste, and the limiting values for Total Organic Carbon and Loss on Ignition exceed the threshold values for Hazardous waste, and therefore should be disposed of at a landfill or treatment facility which is permitted to take Hazardous waste.

The results for the samples at TP4 and TP12 indicate that the limit values for inert waste have not been exceeded and therefore the waste can be disposed of at an inert landfill.

9 CONCLUSIONS AND RECOMMENDATIONS

9.1 Geo-environmental assessment

The results of the GQRA for the site have indicated that any pollutant linkages to end users identified as part of the preliminary risk assessment are unlikely to exist following the redevelopment of the site. This is because the proposed development will essentially either wholly remove the made ground soils from the site as part of the planned basement deepening or alternatively maintain the current encapsulation of soils beneath hardstanding or buildings. Therefore, the associated risks to end users of the site are low.

Whilst no asbestos containing materials (ACM's) were identified during the intrusive investigation, it is possible that groundworks could encounter different conditions from those revealed by the investigation. It is therefore recommended that groundworks be monitored for previously undetected suspect materials and if found appropriate additional testing and advice is sought.

9.2 Re-use of materials and waste

Two of the three samples tested are not likely to be classified as Hazardous waste. However, a sample from trial pit TP3 has potentially been classified as Hazardous due to an elevated concentration of lead.

WAC testing on the sample from TP3 has indicated that the sample is likely to be classified as Hazardous waste to be disposed of in a hazardous landfill. This is due to elevated levels of Total Organic Carbon and Lead, exceeding the thresholds for hazardous and non-hazardous waste.

Prospective landfill operatives should be contacted at an early stage to discuss the waste classification of any material destined for off-site disposal and requirements for additional testing.

FIGURES

APPENDIX A SERVICE CONSTRAINTS

- 1. This report and the site investigation carried out in connection with the report (together the "Services") were compiled and carried out by RSK Environment Limited (RSK) for Grange St. Martins Hotels Ltd (the "client") in accordance with the terms of a contract [RSK Group Standard Terms and Conditions] between RSK and the "client", dated 26th November 2019. The Services were performed by RSK with the skill and care ordinarily exercised by a reasonable environmental consultant at the time the Services were performed. Further, and in particular, the Services were performed by RSK taking into account the limits of the scope of works required by the client, the time scale involved and the resources, including financial and manpower resources, agreed between RSK and the client.
- 2. Other than that, expressly contained in paragraph 1 above, RSK provides no other representation or warranty whether express or implied, in relation to the Services.
- 3. Unless otherwise agreed in writing, the Services were performed by RSK exclusively for the purposes of the Client. RSK is not aware of any interest of or reliance by any party other than the Client in or on the Services. Unless expressly provided in writing, RSK does not authorise, consent or condone any party other than the client relying upon the Services. Should this report or any part of this report, or otherwise details of the Services or any part of the Services be made known to any such party, and such party relies thereon that party does so wholly at its own and sole risk and RSK disclaims any liability to such parties. Any such party would be well advised to seek independent advice from a competent environmental consultant and/or lawyer.
- 4. It is RSK's understanding that this report is to be used for the purpose described in the introduction to the report. That purpose was a significant factor in determining the scope and level of the Services. Should the purpose for which the report is used, or the proposed use of the site change, this report may no longer be valid and any further use of or reliance upon the report in those circumstances by the client without RSK 's review and advice shall be at the client's sole and own risk. Should RSK be requested to review the report after the date of this report, RSK shall be entitled to additional payment at the then existing rates or such other terms as agreed between RSK and the client.
- 5. The passage of time may result in changes in site conditions, regulatory or other legal provisions, technology or economic conditions which could render the report inaccurate or unreliable. The information and conclusions contained in this report should not be relied upon in the future without the written advice of RSK. In the absence of such written advice of RSK, reliance on the report in the future shall be at the Client's own and sole risk. Should RSK be requested to review the report in the future, RSK shall be entitled to additional payment at the then existing rate or such other terms as may be agreed between RSK and the client.
- The observations and conclusions described in this report are based solely upon the Services which were provided pursuant to the agreement between the Client and RSK. RSK has not performed any observations, investigations, studies or testing not specifically set out or required by the contract between the client and RSK. RSK is not liable for the existence of any condition, the discovery of which would require performance of services not otherwise contained in the Services. For the avoidance of doubt, unless otherwise expressly referred to in the introduction to this report, RSK did not seek to evaluate the presence on or off the site of asbestos, invasive plants, electromagnetic fields, lead paint, heavy metals, radon gas or other radioactive or hazardous materials, unless specifically identified in the Services.
- 7. The Services are based upon RSK's observations of existing physical conditions at the Site gained from a visual inspection of the site together with RSK's interpretation of information, including documentation, obtained from third parties and from the Client on the history and usage of the site, unless specifically identified in the Services or accreditation system (such as UKAS ISO 17020:2012 clause 7.1.6):

- a. The Services were based on information and/or analysis provided by independent testing and information services or laboratories upon which RSK was reasonably entitled to rely.
- b. The Services were limited by the accuracy of the information, including documentation, reviewed by RSK and the observations possible at the time of the visual inspection.
- c. The Services did not attempt to independently verify the accuracy or completeness of information, documentation or materials received from the client or third parties, including laboratories and information services, during the performance of the Services.

RSK is not liable for any inaccurate information or conclusions, the discovery of which inaccuracies required the doing of any act including the gathering of any information which was not reasonably available to RSK and including the doing of any independent investigation of the information provided to RSK save as otherwise provided in the terms of the contract between the Client and RSK.

- The intrusive environmental site investigation aspects of the Services are a limited sampling of the site at pre-determined locations based on the known historic / operational configuration of the site. The conclusions given in this report are based on information gathered at the specific test locations and can only be extrapolated to an undefined limited area around those locations. The extent of the limited area depends on the properties of the materials adjacent and local conditions, together with the position of any current structures and underground utilities and facilities, and natural and other activities on site. In addition, chemical analysis was carried out for a limited number of parameters (as stipulated in the scope between the client and RSK, based on an understanding of the available operational and historical information) and it should not be inferred that other chemical species are not present.
- 9. Any site drawing(s) provided in this report is (are) not meant to be an accurate base plan but is (are) used to present the general relative locations of features on, and surrounding, the site. Features (intrusive and sample locations etc) annotated on site plans are not drawn to scale but are centred over the approximate location. Such features should not be used for setting out and should be considered indicative only.
- 10. The comments given in this report and the opinions expressed are based on the ground conditions encountered during the site work and on the results of tests made in the field and in the laboratory. However, there may be conditions pertaining to the site that have not been disclosed by the investigation and therefore could not be taken into account. In particular, it should be noted that there may be areas of made ground not detected due to the limited nature of the investigation or the thickness and quality of made ground across the site may be variable. In addition, groundwater levels and ground gas concentrations and flows, may vary from those reported due to seasonal, or other, effects and the limitations stated in the data should be recognised.
- 11. Asbestos is often observed to be present in soils in discrete areas. Whilst asbestos-containing materials may have been locally encountered during the fieldworks or supporting laboratory analysis, the history of brownfield and demolition sites indicates that asbestos fibres may be present more widely in soils and aggregates, which could be encountered during more extensive ground works.
- 12. Unless stated otherwise, only preliminary geotechnical recommendations are presented in this report and these should be verified in a Geotechnical Design Report, once proposed construction and structural design proposals are confirmed.

APPENDIX B SUMMARY OF LEGISLATION AND POLICY RELATING TO CONTAMINATED LAND

Part IIA of the Environmental Protection Act 1990

Part IIA of the Environmental Protection Act 1990 (Part IIA) and its associated Contaminated Land Regulations 2000 (SI 2000/227), which came into force in England on 1 April 2000, formed the basis for the current regulatory framework and the statutory regime for the identification and remediation of contaminated land. Part IIA of the EPA 1990 defines contaminated land as 'any land which appears to the Local Authority in whose area it is situated to be in such a condition by reason of substances in, on or under the land, that significant harm is being caused, or that there is significant possibility of significant harm being caused, or that pollution of controlled waters is being or is likely to be caused'. Controlled waters are considered to include all groundwater, inland waters and estuaries.

In August 2006, the Contaminated Land (England) Regulations 2006 (SI 2006/1380) were implemented, which extended the statutory regime to include Part IIA of the EPA as originally introduced on 1 April 2000, together with changes intended chiefly to address land that is contaminated by virtue of radioactivity. These have been replaced subsequently by the Contaminated Land (England) (Amendment) Regulations 2012, which now exclude land that is contaminated by virtue of radioactivity.

The intention of Part IIA is to deal with contaminated land issues that are considered to cause significant harm on land that is not undergoing development (see Environmental Protection Act 1990: Part 2A Contaminated Land Statutory Guidance, April 2012). This document replaces Annex III of Defra Circular 01/2006, published in September 2006 (the remainder of this document is now obsolete).

Planning Policy

Contaminated land is often dealt with through planning because of land redevelopment. This approach was documented in Planning Policy Statement: Planning and Pollution Control PPS23, which states that it remains the responsibility of the landowner and developer to identify land affected by contamination and carry out sufficient remediation to render the land suitable for use. PPS23 was withdrawn early in 2012 and has been replaced by much reduced guidance within the National Planning Policy Framework (NPPF), reference ISBN: 978-1-5286-1033-9, February 2019.

The new framework has only limited guidance on contaminated land, as follows:

Chapter 11. Making effective use of land

- 117 Planning policies and decisions should promote an effective use of land in meeting the need for homes and other uses, while safeguarding and improving the environment and ensuring safe and healthy living conditions. Strategic policies should set out a clear strategy for accommodating objectively assessed needs, in a way that makes as much use as possible of previously-developed or 'brownfield' land.
- 118. Planning policies and decisions should:

c) give substantial weight to the value of using suitable brownfield land within settlements for homes and other identified needs, and support appropriate opportunities to remediate despoiled, degraded, derelict, contaminated or unstable land.

Chapter 15. Conserving and enhancing the natural environment

- 170. Planning policies and decisions should contribute to and enhance the natural and local environment by:
 - e) preventing new and existing development from contributing to, being put at unacceptable risk from, or being adversely affected by, unacceptable levels of soil, air, water or noise pollution or land instability. Development should, wherever possible, help to improve local environmental conditions such as air and water quality, taking into account relevant information such as river basin management plans; and
 - f) remediating and mitigating despoiled, degraded, derelict, contaminated and unstable land, where appropriate.

Ground conditions and pollution

- 178. Planning policies and decisions should ensure that:
 - a) a site is suitable for its proposed use taking account of ground conditions and any risks arising from land instability and contamination. This includes risks arising from natural hazards or former activities such as mining, and any proposals for mitigation including land remediation (as well as potential impacts on the natural environment arising from that remediation);
 - b) after remediation, as a minimum, land should not be capable of being determined as contaminated land under Part 2A of the Environmental Protection Act 1990; and
 - c) adequate site investigation information, prepared by a competent person, is available to inform these assessments.
- 179. Where a site is affected by contamination or land stability issues, responsibility for securing a safe development rests with the developer and/or landowner.

Water Resources Act (WRA)

The Water Resources Act 1991 (Amendment) (England and Wales) Regulations 2009 updated the Water Resources Act 1991, which introduced the offence of causing or knowingly permitting pollution of controlled waters. The Act provides the Environment Agency with powers to implement remediation necessary to protect controlled waters and recover all reasonable costs of doing so.

Water Framework Directive (WFD)

The Water Framework Directive 2000/60/EC is designed to:

- enhance the status and prevent further deterioration of aquatic ecosystems and associated wetlands that depend on the aquatic ecosystems
- promote the sustainable use of water
- reduce pollution of water, especially by 'priority' and 'priority hazardous' substances

ensure progressive reduction of groundwater pollution.

The WFD requires a management plan for each river basin be developed every six years.

Groundwater Directive (GWD)

The 1980 Groundwater Directive 80/68/EEC and the 2006 Groundwater Daughter Directive 2006/118/EC of the WFD are the main European legislation in place to protect groundwater. The 1980 Directive is due to be repealed in December 2013. The European legislation has been transposed into national legislation by regulations and directions to the Environment Agency.

Priority Substances Directive (PSD)

The Priority Substances Directive 2008/105/EC is a 'Daughter' Directive of the WFD, which sets out a priority list of substances posing a threat to or via the aquatic environment. The PSD establishes environmental quality standards for priority substances, which have been set at concentrations that are safe for the aquatic environment and for human health. In addition, there is a further aim of reducing (or eliminating) pollution of surface water (rivers, lakes, estuaries and coastal waters) by pollutants on the list. The WFD requires that countries establish a list of dangerous substances that are being discharged and EQS for them. In England and Wales, this list is provided in the River Basin Districts Typology, Standards and Groundwater threshold values (Water Framework Directive) (England and Wales) Directions 2010. In order to achieve the objectives of the WFD, classification schemes are used to describe where the water environment is of good quality and where it may require improvement.

Environmental Permitting Regulations (EPR)

The Environmental Permitting (England and Wales) Regulations 2016 (as amended) provide a single regulatory framework that streamlines and integrates waste management licensing, pollution prevention and control, water discharge consenting, groundwater authorisations, and radioactive substances regulation. Schedule 22, paragraph 6 of EPR 2016 states: 'the regulator must, in exercising its relevant functions, take all necessary measures - (a) to prevent the input of any hazardous substance to groundwater; and (b) to limit the input of non-hazardous pollutants to groundwater so as to ensure that such inputs do not cause pollution of groundwater.'

Notes:

- 1. The above information is provided for background but does not constitute site-specific advice
- 2. The above summary applies to England only. Variations exist within other countries of the United Kingdom

1. Introduction

A-squared Studio Engineers Ltd (A-squared) has been engaged by Heyne Tillett Steel Ltd (HTS) to prepare a desk study for the proposed redevelopment works located at the former Central St Martins site in Holborn, London.

1.1. Study Aims and Objectives

The desk study provides a preliminary assessment of the proposed development with regards to ground engineering considerations and potential geo-environmental risks.

Based on information available in the public domain, the desk study makes preliminary recommendations regarding:

- · Potential foundation design options.
- Basement retention considerations.
- The identification of geo-hazards that may affect design and construction operations.
- Identification of hazards and associated risk of potential ground contamination.
- Recommendations for future ground investigation.

The outcomes of this desk study are of a preliminary nature and have been developed based on information current at the time of writing. The information provided herein has been compiled in order to support design development and is not suitable for detailed design or scheme costing purposes.

1.2. Information Sources

The principal sources of information provided by the project team, which have informed the preliminary assessments presented herein, include the following:

- Updated scheme massing document produced by Orms Designers & Architects Ltd, dated 15th October 2019 (ref: GSM-ORM-00-XX-PP-A-12001)
- Measured Building Survey provided by Heyne Tillett Steel Ltd
- Envirocheck Report for Grange Central St Martins prepared by Landmark Information Group, dated October 2019 (ref: 221284170_1_1)
- Various third party asset plans (LUL, Thames Water, Crossrail etc.)

2. Development Site

2.1. Development Location and Regional Geography

The development site is located in Holborn, Central London, WC1B 4AF, as shown in Figure 2.1. The site is located approximately 150m north of Holborn Underground Station, 550m south of Russell Square Underground Station and borders the A4200 (Southampton Row) and A40 (Theobalds Road and Draker Street). The area is serviced by the A40 and A4200, the Piccadilly Line from Holborn and Russel Square Stations, the Central Line from Holborn Station, and Crossrail 1 from Tottenham Court Road Station approximately 750m to the west. Transport for London (TfL) bus services operate within the district.

The development site falls within the administrative boundaries of the London Borough of Camden, and currently houses four existing structures: Lethaby Building, Red Lion Square, Cochrane Theatre, and Central St Martins Bridge Link and Innovation Centre, as shown in Figure 2.2. Lethaby Building is a five-storey Grade II* Listed building constructed in 1908. Red Lion Square and Cochrane Theatre are thirteen- and four-storey structures, respectively. The Central St Martins Bridge Link structure spans between the Lethaby Building and Red Lion Square. A one-level basement is present underneath all the existing structures, occupying majority of the site footprint, as shown in Figure 2.3. The foundation systems for the existing structures have not been confirmed at this stage, however a combination of shallow and piled foundations are anticipated.

There are no surface water features within 500m of the site. The site is bounded by Theobalds Road to the north, Drake Street to the east, Fisher Street to the south, and Southampton Row to the west.

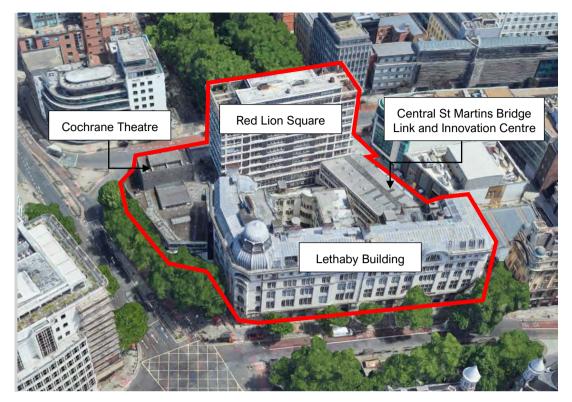

Approximate site boundary marked in red. Image courtesy of Google.

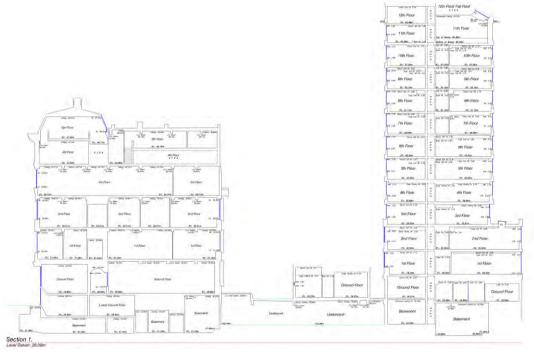

Figure 2.1 Location of the proposed development

Local developments surrounding the site include interspersed commercial, residential and office buildings in all directions, comprising five- to ten-storey structures. The surrounding developments typically comprise various construction materials, such as reinforced concrete, steel, glass and masonry. There are no high-rise structures within close proximity of the proposed development.

Notable buildings in close proximity to the site include Victoria House 50m northwest of the site and the British Museum approximately 300m to the west.

2.2. Site History

Detailed maps and aerial photographs of the site and surrounding area dated 1851 to 2019 (at scales of 1:1,250, 1:2,500, 1:5,280, 1:10,000 and 1:10,560), provided as part of the Envirocheck Report (Appendix A) for the site, have been reviewed. This process has been undertaken to identify any former land uses at the site and within the surrounding area that may have geotechnical or geo-environmental implications for the proposed redevelopment.

The findings are summarised in Table 2.1. Only features considered to have a potential impact on site and usually within a notional 250m radius of the site boundaries are discussed. Any distances quoted for features remote from the site have been scaled from the maps and are approximate. Other information sources available in the public domain have also been reviewed to support this assessment.

Table 2.1 History of the site and surrounding areas

Map Date and Scale	Key On-Site Features	Key Off-Site Features
		Pighen Street formed the southern site boundary and Red Lion Square was labelled immediately to the east. Red Lion Yard was shown 75m northwest.
1851 to 1878 (1:1,056, 1:2,500, 1:5,280)	In 1851, Grange Street ran east to west across the site and King's Gate Street crossed the site from north to south within the western site area. By the early-1870s, the entire site had been developed and appeared to comprise unlabelled	The surrounding area was developed by the 1870s and mainl comprised rows of residential properties with associated gardens. Within a 250m radius of the site various schools, a post office, several public houses, banks, offices, assembly rooms, churches, courts and hotels were present.
	residential and commercial buildings.	A blacking works was labelled 100m south-east of the site and from 180m south-east the Royal Amphitheatre and Circus were labelled, adjacent to a tobacco and snuff manufactory 200m south-east. A stone yard was shown 250m south-west and other yards were present nearby.
1895 to 1898 (1:2,500 and 1:10,560)	By 1896, the buildings within the south-eastern site corner had been replaced by a large building which was labelled as St. John's Church (providing seats for 200). A fire engine station was present within the north-east corner of the site, crossing the northern boundary, extending off-site. Two small plumber shops were shown on site in the late-1880s and a silk dresser was shown on the western boundary.	A bank was present directly north-west of the site by this time and a school and mission room were labelled immediately south. Tram tracks were labelled 25m north-east of the site of Theobald's Road by this time, with the tracks terminating to the north-east of the site. Royal Music Hall later renamed Holborn Empire was shown 150m south. Additional hotels are schools were shown in the wider area by this time.
1908 to 1920 (1:2,500 and	By 1908, Central School was shown within the eastern area of the site, replacing the buildings formerly present. The fire station and some residential properties remained within the northern, southern and central-eastern areas of the site, though the south-western site corner appeared to have been	The tram lines to the north-east had extended along Theobald's Road to the north and a tram tunnel (referred to a an incline from the tramway subway / Kingsway tunnel) was present on Southampton Row immediately off-site to the west The tunnel was opened in 1906.
1:10,560)	cleared and replaced with a large building forming part of the Central School. Grange Street within the northern area of the site had been renamed Parton Street.	The blacking works to the south-east of the site was no longer labelled by the 1910s. The Holborn Empire was labelled 150n south. Various cinemas, schools, public houses and banks were labelled in the surrounding area.
1934 to 1944	The Central School on site was now labelled as the Central School of Arts and Crafts. Historic building plans dated 1944 indicated that the church on site remained at this time. St. George's College, a small printers and builders were shown to the south of Parton Street in the 1940s.	By the early-1940s, a large electrical sub-station (operated by
(1:10,000 and 1:10,560)	A photo of the Central School of Arts and Crafts on site in 1934 is shown below. The tramways and tram tunnel to the north and west of the site were in operation at this time.	the London Electricity Board) was shown immediately to the south of Fisher Street.

Map Date and Scale

Key On-Site Features

Key Off-Site Features

By 1952, the entire eastern and south-eastern area of the site was labelled as ruins, with the church formerly present on site destroyed.

1952 to 1954 (1:1,250 and 1:10,000) The Central School of Arts and Crafts was labelled on the southern site boundary and by the mid-1960s appeared to occupy the central and western areas. The residential properties on the north-eastern site boundary remained and the fire engine station at the north of the site was no longer labelled. York House was labelled in the location of the former fire engine station by the late-1950s.

In 1958, the eastern area of the site was labelled as Red Lion Square service yard. By the mid-1960s, Grange Street at the north of the site had been removed and by 1964 a theatre, known as the Jeanetta Cochrane Theatre, had been constructed replacing York House (which was reported to be under construction in 1960 on historic building plans). A new building within the eastern area of the site replaced the service yard in the mid-1960s and was referred to as the Holborn College of Law, Language and Commerce. This new building appears to be the present-day tower block on site. By this time, the eastern and south-eastern portions of the site were labelled as the Central School of Arts and Crafts and an associated car parking garage.

1957 to 1970 (1:1,250, 1:2,500 and 1:10,000 The newly constructed tower block within the Central School of Arts and Crafts is shown below.

The area directly north of the site had been cleared and Faraday House had been constructed. Various ruins were noted immediately off-site to the north-east and south. A small library was noted directly south of the site. Various new residential developments had been built in the surrounding area, potentially as a result of clearance following bombing of Central London in the 1940s. Various offices (Ministry of Civil Aviation, Board of Trade, Ministry of Labour and National Service, Inland Revenue and the Home Office) were present within the nearby area.

By 1958, historic building plans for the surrounding area indicated that a small garage was in operation 100m east. By 1970, a sunk petrol tank was shown on historic building plans for the surrounding area within an office building to 75m to the south-east of the site. Various commercial buildings, referred to as houses had been constructed in the surrounding area, with further notable redevelopment in areas formerly described as ruins. By the mid-1950s, the tram lines on Theobald's Road to the north and north-east and Southampton Row to the west were no longer shown, though the tunnel to the west remained.

A telephone exchange had been constructed 220m south-east and a hospital was labelled 170m north. Various new office developments had been constructed in the immediate vicinity, with the closest development shown 50m to the north-east. A police station, hospitals and schools were labelled in the surrounding area.

3. Geological Setting

3.1. Information Sources

The following sources were consulted to obtain information regarding the regional and local geological conditions at the proposed development site:

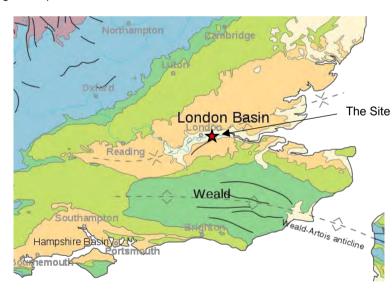

- British Geological Survey, Geological Survey of England and Wales 1:50,000 geological map series Sheet 256.
- British Geological Survey, Geolndex Onshore GIS database.
- · British Geological Survey.
- CIRIA C584, Engineering in the Lambeth Group.
- Publicly available ground investigation reports / information from the London Borough of Camden Planning Portal.

3.2. Regional Geological History

The development site is located within the London Basin, which refers to an approximately triangular synclinal structure in which the sedimentary units underlying London and much of southeast England were deposited.

The basement formation of the London Basin is a deep (~200m thick) layer of Chalk, which was deposited throughout the Upper Cretaceous period during a period of high sea levels and warm oceans.

Following global cooling and retreat of inland seas, the next major event to affect the basin's formation was the Alpine-Himalayan orogeny. Collision of the southern hemisphere African and Indian plates with the northern hemisphere Eurasian plate compressed the Chalk Formation across southeast England. The effect was the creation of a sinusoidal compression wave in the upper crust, which is apparent today in the synclinal structure that is the London Basin and the remnants of the anticlinal structure that was, visible in the adjacent Wealden Dome to the south (Figure 3.1).

Based on the Geologic map of SE England and the English Channel. Wouldloper, distributed under a CC-By-3.0 license.

Figure 3.1 Relationship between the synclinal London Basin and Wealden anticline

Subsequent sea level rise and fall led to deposition of sediments within the London Basin. The oldest (and deepest) sediments in the basin are the Thanet Beds, which comprise fine, silty glauconitic sands originating in shallow seas.

Overlying the Thanet Beds is the Lambeth Group, a depositionally and geographically complex unit which comprises layers of sands and gravels, shelly and mottled clays and minor limestones and lignites and occasional sandstone and conglomerate.

The Lambeth Group was deposited during successions of relatively minor, but important sea level fluctuations (Figure 3.2). The sub-units encountered at any particular geographical location within the London Basin today reflect that location's relative proximity to a prehistoric coastline and whether deposition was dominated by marine, estuarine, lagoonal, fluvial or terrestrial processes.

The base of the Lambeth Group is identified by the Upnor Formation, comprising medium to coarse grained sand with gravels. The base of the unit may be difficult to identify visually due to bioturbation smearing the interface with the underlying Thanet Beds. The presence of glauconite can give the Upnor Formation a green hue. The upper boundary of the Upnor Formation is identified by the presence of colour-mottled clays of the Reading Formation, or dark shelly clay or lignitic sand of the Woolwich Formation. Colour-mottling of deposits within the Lambeth Group are indicative of pedogenic processes that took place during an extended period land exposure and stable sealevel, commonly referred to as the Mid-Lambeth Hiatus.

Figure 3.3 is an extract from CIRIA C583 (2004) that shows the generalised stratigraphic relationship between the various Lambeth Group sub-units. It is noted only the Upnor Formation is present throughout the entire depositional extent of the Lambeth Group.

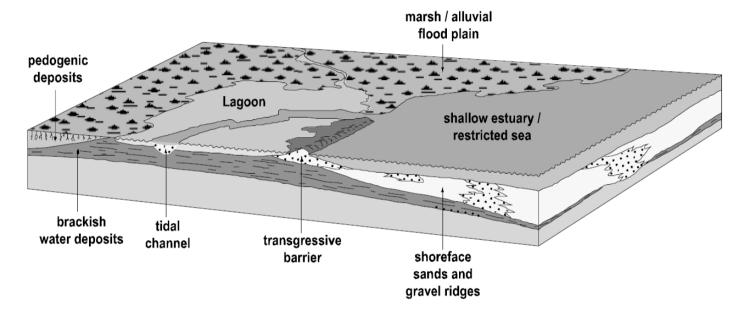

Figure 3.2 Lambeth Group depositional environment (reproduced from CIRIA C583, 2004)

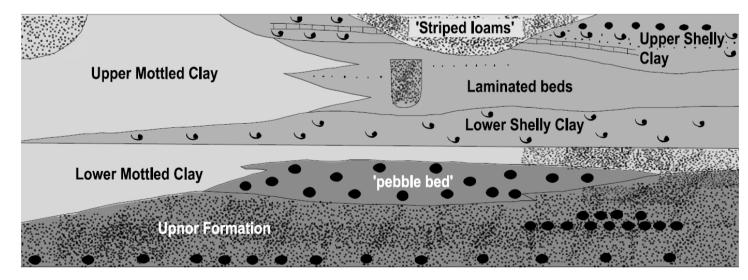

Figure 3.3 Generalised Lambeth Group Succession (reproduced from CIRIA C583, 2004)

Overlying the Lambeth Group are the deposits of the Thames Group that were laid down throughout the Eocene. Following a brief period of uplift and erosion that deposited the basal Harwich Formation, the London Basin was subject to a significant marine transgression, which shifted the coastline far to the west of its present limits.

As the marine transgression progressed and the shallow seas within the basin became ever deeper, the characteristics of deposition changed to fine grained silty clay, which is today identified as the London Clay Formation.

The basal layer of the Thames Group, the Harwich Formation, comprises predominantly coarse grained sediments such as glauconitic silty or clayey sands, silt, fine-to-coarse glauconitic sands, flint gravel beds and hard calcareous concretions.

The dominant Thames Group deposit, the London Clay, has been subdivided into a number of sub-units (A to E), to reflect minor changes in lithography and biostratigraphy.

The upper boundary of the Thames Group is delineated by contact with the lower beds of the Bracklesham Group. Within the London Basin, this typically comprises fine sands of the Bagshot Beds, which were deposited in a shallow marine environment. Within London these deposits have been mostly eroded away and are now confined to a localised area of North London at Highgate and Hampstead Heath.

In the Quaternary period, the London Basin was affected by the Anglian glaciation, where ice sheets extended over the British Isles and terminated north of the Basin. A significant geomorphological consequence of this glacial period was the diversion of the proto-Thames to the south and into the London Basin.

The diversion of the river was followed by erosion of the London Clay and aggradation of extensive sand and gravel river deposits. As the relative sea level reduced, the Thames and its tributaries incised deeper into the underlying London Clay, leaving a series of river terraces (Figure 3.4), which are encountered throughout and near to the surface of the basin today.

Most recently, deposition may take the form of alluvium, comprising sand, silt and clay occurring within the depositional fields of existing tributaries. Additionally, the presence of man-made deposits, such as deep fills associated with historic industry, or site levelling activities are typically encountered within London.

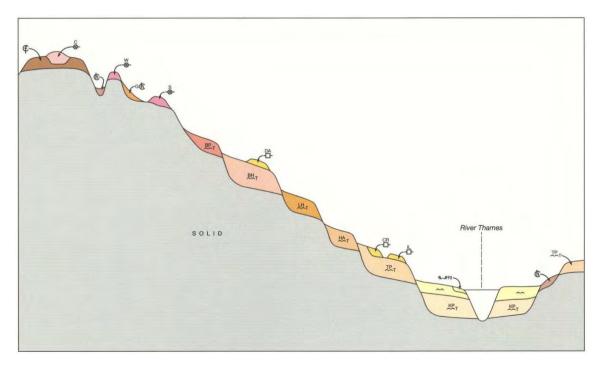

Figure 3.4 Schematic representation of the relationship of river terrace deposits within the London Basin

3.3. Local Geology and Topography

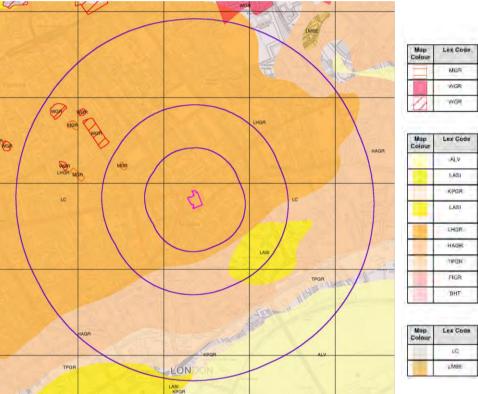

The site is located approximately at the British National Grid coordinates of 5308520E, 181670N.

Figure 3.5 shows the location of the development within the context of a regional geological map. The map illustrates the spatial distribution of superficial (drift) and outcrops at the ground surface (N.B. Made Ground is generally not shown but can be assumed to exist in most developed areas).

The geology map indicates that the site is underlain by Lynch Hill Gravels and London Clay. Below the London Clay, Lambeth Group is expected to overlie Thanet Sands and Chalk.

No areas of infilled land or worked ground are reported within the Envirocheck Report within 500m of the site.

The site is generally level at an elevation of approximately +25.0mOD, with a slight gradient from north to south.

Purple lines indicate 250m, 500m and 1000m buffers from the site boundary.

Figure 3.5 Geological context of the site

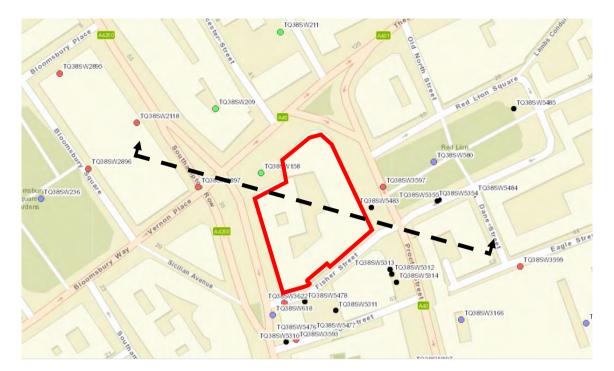

3.4. Historical Ground Investigation Data

The British Geological Survey Geology of Britain web map services provide access to the geographic locations and logs of historical borehole investigations and well installations. Historical boreholes surrounding the site are shown in Figure 3.6. The following surrounding shallow and deep BGS boreholes have been indicatively reproduced in Figure 3.7, showing an approximate northwest-southeast geological section through the site, showing the depths and thicknesses of the underlying soils:

- TQ38SW2895 (135m northwest).
- TQ38SW2897 (26m northwest).
- TQ38SW209 (45m northwest).
- TQ38SW158 (on-site).

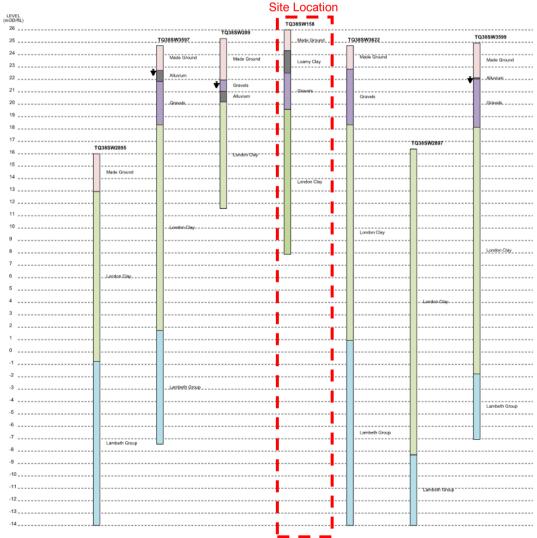

- TQ38SW3622 (5m south).
- TQ38SW3597 (15m east).
- TQ38SW3599 (97m east).

Site boundary marked in red. Northwest-southeast section shown in Figure 3.7 marked by black dashed line.

Figure 3.6 Location of BGS borehole data

Northwest-southeast section.

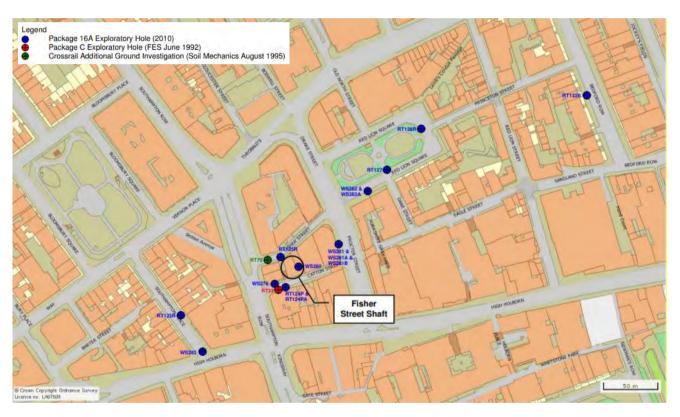

Figure 3.7 Indicative cross-section through historical borehole data

3.5. Planning Portal Geological Setting Information

Historical planning applications and information from the London Borough of Camden Planning Portal from a previous development near the site have been reviewed. The findings from historical ground investigation works associated with Crossrail 1, to the immediate south of the site, have been summarised in this section.

3.5.1. 8 – 10 Southampton Row and 1 Fisher Street Ground Investigation

The existing structure at 8 – 10 Southampton Row and vacant lot at 1 Fisher Street, located directly south of the site, have recently been converted into a hotel building. An Appendix containing *Borehole Information*, previously prepared by Fugro for the Crossrail 1 project in 2010, was included in the application for Full Planning Permission and has been reviewed as part of this desk study. The appendix comprised boring logs of two cable-percussive and rotary cored boreholes to depths of 53.00mBGL and 50.20mBGL. The exploratory hole location plan for these boreholes is shown in Figure 3.8.

Source: Crossrail Limited (February 2019)

Figure 3.8 $\,$ 8 – 10 Southampton Row and 1 Fisher Street borehole location plan

Made Ground, in the form of yellowish brown sandy gravelly clay, was encountered to a maximum depth of 3.0m (+22.0mOD). Beneath this, Langley Silt was encountered in one borehole (RT124PA) extending to a depth of 3.10m (+21.90mOD).

Beneath these strata, the ground investigation encountered the Lynch Hill Gravel member (reddish yellow slightly gravelly sandy clay and yellowish brown slightly clayey sandy gravels). From approximately 7.0mBGL (+18.0mOD), London Clay is encountered, underlain by the Lambeth Group at 24.0mBGL (+1.0mBGL), Thanet Sands at 43.0mBGL (-18.0mOD), and Chalk at 47.5mBGL (-22.5mOD).

Groundwater was encountered within the Made Ground and Lynch Hill Gravels during drilling at the surface (+25.0mOD) and at 2.0mBGL (+23.0mOD).

3.6. Preliminary Ground Model

The information listed in the sections above have been used to determine a preliminary ground model for this site.

Given the recorded phases of development, demolition and redevelopment across the site, including the presence of former roadways across the site, a layer of Made Ground is anticipated to be present across the entire site area. In some areas of the site, several phases of construction appear to have been undertaken since mapping records began. On this basis, the presence of Made Ground is anticipated across the site and the nature and thickness of any such Made Ground is likely to be variable. Based on the available borehole records, up to 3m of Made Ground is anticipated to be present on site.

Table 3.1 summarises the preliminary stratigraphic profile adopted to progress the desk-based review. The ground profiles and associated assumptions will need to be validated and revised based on a site-specific ground investigation.

Table 3.1 Preliminary stratigraphic relationships

Unit	Elevation ^[1] (mOD)	Depth ^[1] (mBGL)	Thickness (m)	Description
Made Ground	+25.0	0.0	3.0	Variable anthropogenic deposits
Lynch Hill Gravels	+22.0	3.0	3.0	Medium dense to dense sandy gravel
London Clay	+19.0	6.0	18.0	Stiff brown clay with partings of silty fine sand
Lambeth Group	+1.0	24.0	19.0	Vertically and laterally variable sequences mainly of clay, some silty or sandy, with some sands and gravels, minor limestones and lignites and occasional sandstone and conglomerate
Thanet Sands	-18.0	43.0	10.5	Grey-brown, fine-grained sand that can be silty/clayey
Chalk	-22.0	46.0	>100.0	Chalk with flints

^{1.} Elevation and depth refer to top of stratum.

3.7. Groundwater Model

The preliminary evaluation of the groundwater regime has been based on the limited data arising from historical investigation, the site setting, general geomorphology and relevant project experience in the area.

The groundwater model is likely to comprise a perched water table, which is sustained within the more permeable superficial strata overlying the low permeability London Clay Formation. The historical data suggests that a perched water table is present within the River Terrace Deposits – between 3-6mBGL; finite bodies / pockets of groundwater may also be present within the Made Ground. It is noted that the perched water table is likely to vary seasonally, as a result of human induced phenomena and hydrogeological features in proximity of the site. The perched water table will be one of the primary engineering considerations for substructure design, hence this aspect will need to be reviewed as part of the site-specific ground investigation for the site.

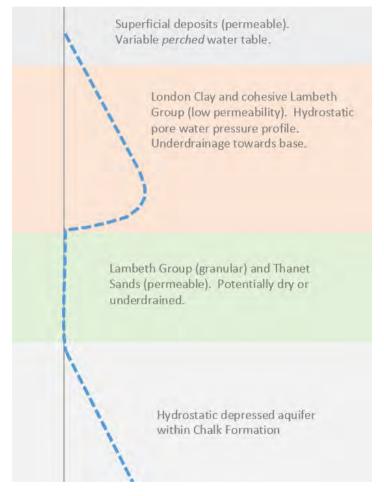

To account for potential variability and seasonal changes, a water level of +22.0mOD (3.0mBGL) is recommended for the assessment of retaining walls in the temporary condition, and +24.0mOD (1.0mBGL) for long term conditions for this preliminary design phase.

It is anticipated that the pore water pressure distribution within the London Clay Formation is likely to be in hydrostatic equilibrium with an average or mean perched water table level. It is therefore recommended at this stage that the pore water pressure be considered in equilibrium with the design water table.

Whilst it is considered that the pore water pressure distribution within the London Clay and upper Lambeth Group clays is hydrostatic, it is possible that the lower portion of the Lambeth Group, Thanet Sands and Chalk Formation are underdrained. Due to historical dewatering from the Chalk aquifer at depth, underdrainage effects are frequently observed within the strata at depth within the London Basin. This facet will be considered as part of the substructure design development; however, this is not likely to represent a significant design driver due to the relative depth of the deep primary aquifer.

The anticipated groundwater regime and pore water pressure distribution are presented in the indicative sketch in Figure 3.9. The engineering implications associated with groundwater and heave are discussed further in the engineering assessment section of the report.

Groundwater monitoring will be required during the ground investigation phase to confirm the hydrogeology of the site. Outline proposals for groundwater monitoring are discussed in Section 7.

Schematic supported by measured data published by Hight et al (1993) for Central London and project experience in the area.

Figure 3.9 Indicative schematic showing anticipated groundwater regime and pore water pressure distribution within the strata underlying the site

4. Environmental Setting

4.1. Archaeology

There are several listed buildings in immediate proximity of the proposed development site. The listed buildings within a 250m radius of the site boundary are shown in Figure 4.1 below.

Source: http://www.historicengland.org.uk/, accessed October 2019.

Figure 4.1 Listed structures within 250m radius of the development site

The following listed structures are present within 50m of the site:

- 6 20 Sicilian Avenue Grade II Listed (list entry number 1378666)
- Baptist Church House and Kingsgate House Grade II* Listed (list entry number 1378782)
- Kingsway Tram Subway (northern section only) Grade II Listed (list entry number 1378792)
- Avenue Chambers Grade II Listed (list entry number 1379092)
- Numbers 23 35 and 35A and Attached Screen to Sicilian Avenue Grade II Listed (list entry number 1378787)
- Central St Martin's College of Art and Design Grade II* Listed (list entry number 1378790)
- Carlisle House Grade II Listed (list entry number 1378785)
- 15 23 Southampton Row Grade II Listed (list entry number 1378786)
- Cochrane Theatre Certificate of Immunity (list entry number 1415270)
- Cochrane Theatre and attached Administrative Block Certificate of Immunity (list entry number 1463729)

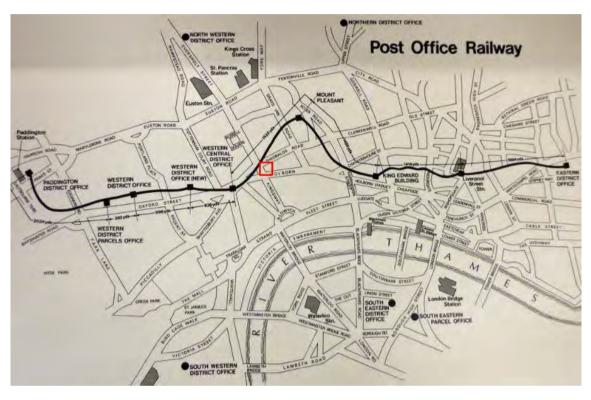

The site falls within the Tier 2 Archaeological Priority Area (APA) 2.11: London Suburbs (as defined by the *London Borough of Camden Archaeological Priority Areas Appraisal* prepared by Historic England, dated October 2018). The APA includes prehistoric evidence,

Roman roads and associated activity, medieval settlement, Civil War defence lines, and the 17th century expansion of London's suburbs. Specialist input may be sought in order to further mitigate any potential risks associated with archaeology.

4.2. Existing Underground Infrastructure and Utilities

4.2.1. Post Office Tunnels

A Post Office tunnel, owned by Royal Mail, is present in close proximity to the northern boundary of the proposed development site, as shown in Figure 4.2. Close to the site, the tunnel elevation decreases gradually towards the east along its length, decreasing from approximately +4.5mOD to +2.5mOD (20.5mBGL to 22.5mBGL).

Based on information provided by HTS

Figure 4.2 Location of the Post Office tunnels (black) relative to the proposed development (red)

4.2.2. TfL Tunnels

The London Underground Limited (LUL) Piccadilly Line tunnels are present west of the development site underneath Southampton Row, as shown in Figure 4.3. The depths of the Piccadilly Line tunnels in this area are currently unknown. It is noted that the proposed development falls within the LUL *zone of influence* (marked in grey).

The Kingsway Tram Tunnel is also present west of the development site along Southampton Row, as shown in Figure 4.3. It is presumed to be located above the Piccadilly Line tunnels; actual depths and dimensions of this tunnel are currently unknown

Crossrail tunnels are present south of the site beneath Fisher Street, as shown in Figure 4.3. The eastbound Crossrail tunnel, located in the immediate vicinity of the site's southern boundary, is expected to have a crown elevation of approximately +6.5mOD and an outer diameter of approximately 6.80m.

Based on information provided by HTS.

Figure 4.3 Location of the Piccadilly Line (blue), Kingsway Tram (light green) and Crossrail (dark green) tunnels relative to the site (red)

4.2.3. Utilities and Services

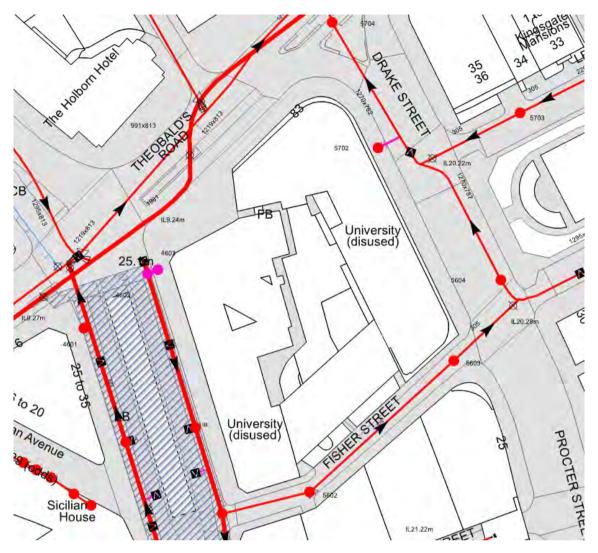

Third party asset drawings provided by HTS indicate the presence of several elements of buried infrastructure surrounding the site. Thames Water wastewater and clean water utilities have been identified beneath the roads bounding the site (Theobalds Road, Drake Street, Fisher Street, and Southampton Row) and several other streets immediately surrounding the site. The locations of these utilities are shown in Figure 4.4 and Figure 4.5.

Additional utilities searches carried out through LinesearchbeforeUdig Limited indicate that Zayo Group UK Ltd ducts housing fibre-optic cables, UK Power Networks electricity lines, and GTT fibre-optic cables are present in the immediate vicinity of the site beneath Theobalds Road, Southampton Row, Fisher Street, and High Holborn. The locations of these utilities are shown in Figure 4.6 to Figure 4.8.

Other asset owners with existing underground services that may be impacted by the proposed development include the following:

- London Borough of Camden and the Greater London Authority.
- BT (BT Group Plc) and Virgin Media Ltd. Telecoms.
- Cadent Gas Ltd. and Southern Gas Networks Plc Gas.

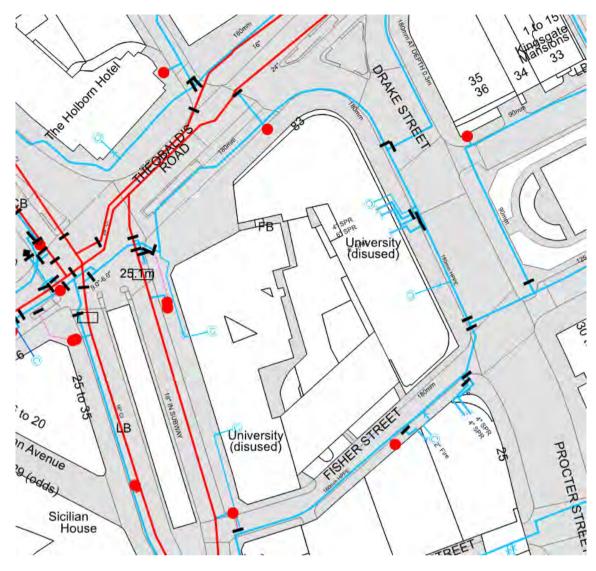

No further information regarding utilities is currently available. It is recommended that the presence of utilities in the vicinity of the site be investigated further based on the preliminary information above (and that appropriate utility searches be procured in a timely fashion).

Figure 4.8 Location of GTT fibre-optic cables relative to the development site

4.3. Unexploded Ordnance

A preliminary unexploded ordnance (UXO) threat assessment conducted by 6 Alpha Associates has been provided as part of the Envirocheck data set. The assessment indicates that the site is within the Holborn Metropolitan Borough, which recorded 216 High Explosive (HE) bomb strikes per 100 hectares; a very high level of bombing. A command post, located 900m south of the site, was identified by Luftwaffe aerial reconnaissance photography as a primary bombing target. ARP records identified three HE bomb strikes on-site. A further five HE bomb strikes were identified within 65m of the site boundary, with the closest being 25m to the northwest. Forty-three Unexploded Bombs (UXBs) were also identified within 1km of the site, the closest being 45m west of the site boundary. London County Council (LCC) bomb damage mapping recorded areas of "total destruction," "damage beyond repair," "serious damage; but repairable at cost" and "general blast damage; minor in nature" on-site and in the immediate vicinity.

The site has been given a UXO hazard rating of *Likely* and it is recommended that a detailed UXO threat and risk assessment be performed to reduce risk as low as reasonably possible during intrusive activities.

Details of risk management strategies are outlined in CIRIA C681.

Based on the preliminary risk assessment performed by 6 Alpha Associates, it is recommended that a UXO specialist is engaged to assess the site and provide recommendations on appropriate mitigation measures and strategies. As a minimum, it is strongly recommended that all contractors and specialist subcontractors undertaking intrusive works adopt appropriate procedures to mitigate against risks associated with encountering UXOs on site.

In this particular instance, this may include briefing all site staff and operators with regards to the inherent risks, establishing simple, robust and safe procedures in the event where UXOs are encountered. This aspect should be confirmed and detailed in all relevant contractor/works method statements in order to ensure appropriate protocols are adopted.

4.4. Hydrology

There are no discharge consents listed within 650m of the site boundary and no records of enforcements and prohibition notices within 600m of the site.

There are no recorded prosecutions relating to controlled waters that have taken place within 750m of the site and no Integrated Pollution Prevention Controls (IPPC) within 1km.

There are two Local Authority Pollution Prevention Controls (LAPPC) reported within a 400m radius of the site. The closest LAPPC is recorded 245m to the north-east of the site and relates to Matthew Daniel Dry Cleaners Ltd at 13 Theobalds Road (permit reference: PPC/DC26 dated January 2007) for PG6/46 dry cleaning. The control remains permitted. The second control relates to Capri Cleaners at 148 Southampton Row (permit reference: PPC/DC23 dated January 2007) also for PG6/46 dry cleaning. This control also remains permitted. A further six LAPPC are listed between 400m and 700m from the site boundary which relate to air pollution control and dry cleaning. One of which, located 654m to the north-west of the site at 3 to 16 Woburn Place relates to a closed petrol filling station.

The nearest surface water feature to the site was listed 859m to the east of the site and appeared to relate to the River Thames, which is present from 750m to the east, south and south-east of the site.

There is one record of a pollution incident to controlled waters recorded by Envirocheck to have taken place on site. The spillage of fire water / foam (recorded as a miscellaneous pollutant) reportedly occurred in January 1996 (incident reference: SE960007). This incident was recorded as a minor incident (Category 3). No further incidents are recorded to have taken place within 550m of the site boundary, including no significant incidents (Category 2) within 950m. There are no substantiated pollution incident register incidents relating to land or water recorded within 1km of the site.

4.5. Flood Risk

The site is located within an area with the potential for groundwater flooding of property situated below ground level. Various areas over 60m from the site are listed as having the potential for groundwater flooding to occur at the surface. The site is not located within Flood Zone 2 or 3 and is not listed as at risk of surface water flooding from rivers or seas without defences. The site was not recorded to benefit from flood defences and no flood water storage areas were recorded in the site vicinity. No further consideration of flood risk is given in this report.

Specialist flood risk advice should be sought with regards to drainage and flooding.

4.6. Hydrogeology

The Groundwater Vulnerability Map of England and the Environment Agency website have been reviewed to determine the aquifer designations for the underlying geology at the site. The Superficial Deposits comprising the Lynch Hill Gravel Member comprise mainly Sand and Gravel with local lenses of Silt, Clay or Peat. These deposits are classified as a Secondary A Aquifer and contain permeable layers capable of supporting water supplies at a local rather than strategic scale, in some cases forming an important source of base flow to rivers. These strata are generally aquifers formerly classified as Minor Aquifers. Within the Envirocheck Report for the site, the Superficial Deposits are recorded as likely to be between 3m and 10m thick and having a medium vulnerability with a mixed pollutant speed.

The London Clay Formation is listed as Unproductive Strata. Unproductive Strata are low permeability strata which are not considered to retain significant quantities of groundwater. If groundwater is present within Unproductive Strata, for example within more permeable lenses or small fissures, it is typically discontinuous, of low value and very low sensitivity.

The site is not located within a Groundwater Source Protection Zone and there are no Groundwater Source Protection Zones within 1km.

There are no water abstractions recorded within 600m of the site. There are four water abstractions listed within the Envirocheck Report for the site between 643m and 645m from the site boundary at the London School of Hygiene and Tropical Medicine. Groundwater is abstracted from two boreholes at Keppel Street in Bloomsbury for a heat pump. Various iterations of the abstraction license are recorded and date back to 2011. No details on the quantity of groundwater abstracted are provided. No further groundwater abstractions are listed within 800m and no surface water abstractions are recorded within 1km of the site.

There is one Water Industry Act Referral recorded in the Envirocheck Report within 2km of the site which relates to Aeromet International plc 714m east at 10 Norwich Street. Processes which result in the discharge of Special Category effluents under The Trade Effluents (prescribed processes and substances) Regulations. The application has been cancelled.

4.7. Mining and Mineral Extraction

The site is not listed within the Envirocheck Report as within an area affected by coal mining.

There are no BGS Mineral Sites listed within the Envirocheck Report within 1km of the site and no man-made mining cavities within 1km. The closest recorded natural cavity to the site is located over 500m from the site boundary.

4.8. Soil Chemistry

A review of the BGS soil chemistry data for the average concentrations in the area of the site, included within the Envirocheck Report, has been undertaken and is summarised below. These concentrations are considered to be background levels for heavy metals at the site and should be considered in any future contaminated land assessment undertaken.

Arsenic: 15 to 25 mg/kg.Cadmium: < 1.8 mg/kg.

• Chromium: 60 to 90 mg/kg.

Lead: 300 to 600 mg/kg.

Nickel: 15 to 30 mg/kg.

It should be noted that the concentrations for all contaminants indicated above do not exceed the relevant residential without plant uptake and commercial / industrial Generic Assessment Criteria (GAC), which include Soil Guidance Values (SGVs) (CL:aire), Category 4 Screening Levels (C4SLs) (DEFRA) and the 2014 Land Quality Management (LQM) / Chartered Institute of Environmental Health (CIEH) Suitable for Use Levels for Human Health Risk Assessment (S4ULs). These concentrations should be considered during any future ground investigation and associated risk assessment.

4.9. Ground Stability

The potential ground stability hazards associated with the geology at the site, as outlined in the Envirocheck Report, have been summarised below:

• Collapsible Ground: Very Low.

Compressible Ground: **No Hazard**.

Ground Dissolution: No Hazard.

Landslide Ground Instability: Very Low.

Running Sand: Very Low.

Shrinking or Swelling Clay: No Hazard (Moderate Risk from 45m north-west).

4.10. Radon

The Indicative Atlas of Radon for England and Wales and the Envirocheck Report indicate that the site is within a Lower Probability Radon Area (less than 1% of homes are estimated to be at or above the Action Level). The BGS and the Building Research Establishment Radon Guidance Document indicates that no radon protection measures are required in the construction of new dwelling or extensions required in this area.

4.11. Waste Management and Hazardous Materials

There are no historical landfill sites recorded within 400m of the site. The closest entry relates to the former Lincolns Inn Fields landfill on Portugal Street, approximately 420m to the south-east. No details relating to the dates that the landfill was reportedly active, the type of waste deposited, or the size of the facility are provided within the Envirocheck Report. OS mapping for this area shows a small public area of landscaping in this area and could potentially have been the site of small-scale filling. No further historic landfill sites are reported within 2km of the site boundary.

There is one licensed waste transfer site / waste management facility listed within 750m of the site within the Envirocheck Report. This facility is listed 345m west and relates to mobile plant for the treatment of soil (<75,000 tonnes per day), operated by Recycled in Ardleigh Limited. The license for the waste management facility dates back to February 2017. A further entry for mobile plant for land spreading was recorded 800m to the east of the site.

There are no Local Authority landfill sites recorded within 2km of the site.

There are no registered waste treatment or disposal sites reported within 425m of the site. The closest entry relates to the Imperial Cancer Research Fund at 44 to 49 Lincoln's Inn Fields in Westminster, approximately 436m to the south-east. This facility may relate to the same historical landfill location detailed above. The facility dates back to October 1991, the license for which is no longer active. The site was categorised as a very small (less than 10,000 tonnes per year) facility and waste was incinerated at this location. The incinerated wastes included organic solvents, paper and cardboard, plastics, clinical and general non-putrescible wastes.

There are no areas of infilled land (water and non-water) listed within 1km of the site.

There are no hazardous substances listed within 950m of the site.

There are two listings for radioactive substances within 300m of the site. The closest entry to the site is recorded 62m to the south at 1 Southampton Row. The entry relates to York Cameras (London) Ltd for the disposal of radioactive substances (permit reference: AR3933). Due to the nature of the processes in this location the quantities are assumed to be very small. The authorisation is listed as revoked or cancelled. Cancer Research UK at 61 Lincolns Inn Fields 295m south of the site is registered for the keeping and use of radioactive materials (permit reference: AL1032). The consent for these substances dates back to March 1991. The permit is recorded as having been superseded by a substantial or non-substantial variation. Further permits for registered radioactive substances are recorded between 301m and 328m to the north of the site at Great Ormond Street Hospital for Sick Children. These permits relate to the disposal of radioactive waste and date back to between 1991 and 2006. Authorisation for both permits has been superseded by a substantial or non-substantial variation. Various other registered substances are recorded from 325m from the site boundary and relate to various hospitals medical and educational institutes including University College London, Cancer Research UK, The London School of Hygiene and Tropical Medicine, The British Museum, and universities in the wider area and relate to the disposal of radioactive waste, generated from research and medical operations.

4.12. Contemporary Trade Directories

A total of ninety-seven entries were recorded within 250m of the site boundary. Twenty-three contemporary trade directory entries were recorded between 25m and 100m from the site boundary. The four closest entries to the site were all recorded 33m west and related to Mipow UK Ltd (electronic component manufacturers and distributors), Ciccone (shirt makers) and Smartline Collections (dry cleaners). All entries were listed as inactive. Further inactive entries were recorded 41m and 42m east of the site and related to offices associated with Wjj Waste Ltd (waste disposal services) and Future Tech Waste Management (waste merchants). Two further inactive entries were recorded 49m south-west of the site and related to the offices of Nyotoa Minerals UK Ltd (metal mining) and a photographic processor, operated as Sky Photographic Services Ltd. B&B Opticals Ltd (optical goods manufacture) was recorded 54m to the south of the site, and 57m north-east, Bluewater Forklift Hire was recorded. Both entries were listed within the Envirocheck Report as inactive. Further inactive entries between 70m and 100m from the site boundary included greeting card publishers and wholesalers, copying and duplicating services, gas suppliers (offices), photographic processing, forklift hire, engineers, printers, oven cleaning and a hardware store were recorded. Active copying and duplicating services were noted 99m east and active catering equipment was recorded 91m west.

Active entries listed between 100m and 250m from the site included dry cleaners, hygiene and cleansing services, laundries and laundrettes, cycle accessories, manufacturer and wholesalers, oil and gas exploration supplies and services (offices), electronic goods sales, manufacturer and wholesalers, domestic and commercial cleaning services, water softeners, garage services, cinema equipment, scientific apparatus and instrument manufacturer, waste disposal services, photocopiers, engineers, oil company offices and food product manufacture.

A further one-hundred and eighty-four entries were recorded between 251m and 500m from the site boundary. No fuel stations were recorded within the Envirocheck Report within 650m of the site.

4.13. Ecology

No ecological receptors have been identified on site at this stage and no vegetation was noted to be present on site.

There are no sensitive land uses identified within 1km of the site boundary including Marine Nature Reserves, Ramsar sites, areas of scientific interest, protected areas, areas of ancient woodland, adopted greenbelt or national parks.

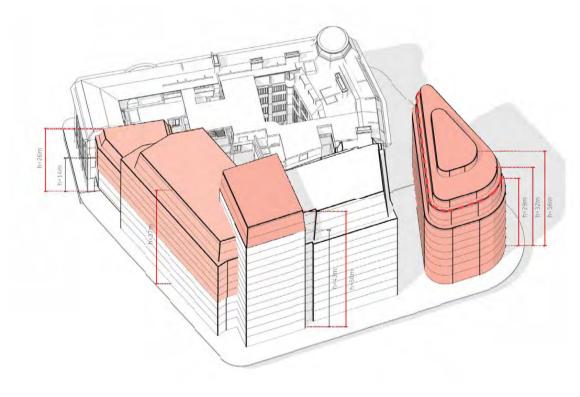

5. Proposed Development

5.1. Overview

The current scheme for the proposed development comprises the refurbishment of the existing Lethaby Building to convert it into a 105-room hotel, the refurbishment and expansion of the existing Red Lion Square, Central St Martins Bridge Link and Innovation Centre sites into a seven- to fourteen-storey hotel structure, and the construction of a separate ten-storey residential structure to replace the existing Cochrane Theatre in the northeast corner of the site. Figure 5.1 shows the proposed massing of the development site, while Figure 5.2 shows the proposed ground floor plan.

A proposed one- to three-level basement is expected to cover majority of the site footprint. The existing one-level basement underneath Red Lion Square, Cochrane Theatre, and Central St Martins Bridge Link and Innovation Centre will be deepened into a three-level basement, while the existing one-level basement underneath Lethaby Building will be retained and will not be deepened. The proposed basement floor plans are shown in Figure 5.3, and a proposed section is shown in Figure 5.4

New massing shown in red.

Source: *Updated massing presentation* (2019) by Orns, provided by HTS.

Figure 5.3 Proposed basement floor plans

Source: Updated massing presentation (2019) by Orns, provided by HTS.

Figure 5.4 East-west section through the site showing the proposed basement depths

Further information about the proposed development (including architectural plans current at the time of writing) is included in Appendix B.

5.2. Structural System

The proposed materials of construction for the new hotel and residential developments have not yet been finalised and are currently under review/subject to design development. At this preliminary stage, reinforced concrete or steel frame construction are being considered. Assumed preliminary loading values are detailed in Section 7.

Based on review of the preliminary information provided, for the purposes of the desk study it is assumed that the stability system for both the both the proposed hotel and residential structures will consist of:

- A concrete stability core that provides resistance to:
 - o Vertical actions due to permanent and imposed loads on floor plates.
 - o Horizontal loads, moments and torsions arising from wind loading on the exterior facade of the building and/or notional horizontal forces that are transferred to the core via diaphragm action of the floor plates.
- Isolated columns of reinforced concrete or steel construction would support the remaining tributary area of floor plates not supported by the core.

It is assumed that the existing superstructures and substructures of Lethaby Building, Red Lion Square, and Central St Martins Bridge Link and Innovation Centre will be in part reused, with additional substructure elements (earth retention systems / foundations) added as required to suit the scheme intent. The proposed refurbishment works may also include the addition of new lift pits and cores.

6. Preliminary Contaminated Land Risk Assessment

6.1. General Approach

A means to assess the risk posed by potential contamination on or under a site is to carry out a Preliminary Contaminated Land Risk Assessment. The risk assessment process if defined within the Contaminated Land Statutory Guidance of Part 2a of the Environmental Protection Act 1990 (DEFRA 2012). The Statutory Guidance states that:

For a relevant risk to exist there needs to be one or more contaminant, pathway, receptor linkages – known as a **contaminant linkage** - by which a relevant receptor might be affected by the contaminants in question. In other words, for a risk to exist there must be contaminants present in, on or under the land in a form and quantity that poses a hazard, and one or more pathways by which they might significantly harm people, the environment, or property; or significantly pollute controlled waters. For the purposes of the Guidance:

- (a) A **contaminant** is a substance which is in, on or under the land and which has the potential to cause significant harm to a relevant receptor, or to cause significant pollution of controlled waters.
- (b) A **receptor** is something that could be adversely affected by a contaminant, for example a person, an organism, an ecosystem, property or controlled waters.
- (c) A pathway is a route by which a receptor is or might be affected by a contaminant.

The contaminant linkage is described within the Statutory Guidance as:

The relationship between a contaminant, a pathway and a receptor. All three elements of a contaminant linkage must exist in relation to particular land before the land can be considered potentially to be contaminated land under Part2a, including evidence of the actual presence of contaminants. The term significant *contaminant linkage* means a contaminant linkage which gives rise to a level of risk sufficient to justify a piece of land being determined as Contaminated Land. The term *significant contaminant* means the contaminant which forms part of a *significant contaminant linkage*.

Part 2a of the guidance takes a risk-based approach to define contaminated land. For the purposes of this guidance, *risk* means the combination of:

The relationship between a contaminant, a pathway and a receptor. All three elements of a contaminant linkage must exist in relation to particular land before the land can be considered potentially to be contaminated land under Part2a, including evidence of the actual presence of contaminants. The term *significant contaminant linkage* means a contaminant linkage which gives rise to a level of risk sufficient to justify a piece of land being determined as Contaminated Land. The term *significant contaminant* means the contaminant which forms part of a *significant contaminant linkage*.

Part 2a of the guidance takes a risk-based approach to define contaminated land. For the purposes of this guidance, risk means the combination of:

- (a) the likelihood that harm, or pollution of water, will occur as a result of contaminants in, on or under the land; and
- (b) the scale and seriousness of such harm or pollution if it did occur.

The following sections relate to a Qualitative Preliminary Contaminated Land Risk Assessment of the site and surrounding environs based on the results of the Desk Study.

The data within this assessment will be employed to produce a Conceptual Site Model which will be tested to assess if a *significant possibility of significant harm* to human health, non-human health or significant pollution to controlled waters is likely to occur and the risk level posed by any such linkages. The risk level classification system employed in the risk assessment is generally based upon those described in CIRIA Report C552: Contaminated Land Risk Assessment: A Guide to Good Practice (*Rudland et al 2001*).

6.2. Contaminated Land Risk Assessment

6.2.1. Potential Contaminants of Concern

The potential contamination sources identified as part of this assessment are summarised below:

On-Site Sources

- Due to the age of the buildings on site, thought to date back to the early 1900s (London College of Arts and Crafts) and the mid-1960s (Theatre and original Holborn College of Law, Language and Commerce), it is likely that asbestos-containing materials (ACM) are present within the existing building fabrics (including internal fittings, pipe lagging and roofing materials). The thickness of the Made Ground is likely to be extensive across the site due to the scale of the historic and current buildings (multi-storey structures, with high loading) and the presence of former roads across the site. In addition, WWII bomb damage appears to have seen uncontrolled demolition take place on site, with large areas of the site reconstructed following the end of the war in the 1940s and 1950s. On this basis, and the logs obtained from nearby historical BGS boreholes, Made Ground of unknown chemical composition may be present to potentially significant depths of up to 3m below ground level (bgl). The potential contaminants of concern include heavy metals, asbestos, hydrocarbons (PAHs and TPH), Volatile and Semi-Volatile Organic Compounds (VOCs and SVOCs), BTEX, MTBE, acidity, inorganics, elevated sulphate, vapours and ground gases (methane, carbon dioxide and hydrocarbons). Depending on the quantity of organic and putrescible material present in these soils, the Made Ground may also represent a source of ground gas and vapours. Soil contamination from asbestos can be caused through the inappropriate use and poor care of ACM in the building fabric and curtilage causing cross contamination during historic demolition (controlled or uncontrolled) or renovation works. ACM can also be encountered within imported sub-base / fill materials associated with previous construction or renovation works (such as the construction of a new hardstanding). Taking into account the urban setting of the site, the potential for ACM to be present in soils underlying the existing hardstanding and building footprint should be considered.
- A 2009 building survey indicated the presence of several tanks (of unknown use), boiler and plant rooms within the basement of the original College building at the west and south of the site. From around 2015, the educational facilities on site no longer appeared to be in use and the condition of any residual infrastructure at the site within the basement is currently unknown. These tanks, boiler and plant rooms, generators or other plant are potential sources of contamination on site. The potential contaminants of concern include hydrocarbons (PAHs and TPH), Volatile and Semi-Volatile Organic Compounds (VOCs and SVOCs), BTEX, MTBE, and hydrocarbon vapours.
- Historical activities undertaken at or encroaching onto the site including the schools and colleges, theatre, fire engine station, plumber shops, silk dressers, church, a garage, car park and a service yard are likely to have impacted the site. Contaminants associated with these activities may include metals, inorganics, asbestos, hydrocarbons (PAHs and TPH), pH adjusters, phenols, VOCs / SVOCs, BTEX, MTBE, vapours and ground gases (methane, carbon dioxide and hydrocarbons).
- The spillage of fire foam on site in 1996 is not considered to pose a risk due to the reporting and clean-up of the incident, the nature of the pollutant, the time since the spillage occurred and the nature of hardstanding surfacing across the site.

Off-Site Sources

- Contemporary sources such as the nearby retail units, offices and other commercial uses have been ruled out as significant off-site sources. Given the nature and scale of these operations, recent activities within 100m of the site boundary, including a dry cleaners 33m west and a photographic processor 54m south are considered to have a limited potential to impact the site. This is due to modern environmental controls and permitting and the absence of any recorded incidents or spills associated with these, or similar land uses within 550m of the site.
- Historical land uses including the adjacent tramlines, the former electrical sub-station to the south of a sunk petrol tank within an office building 75m south-east, a blacking works 100m south-east, a small garage 100m east and a tobacco and snuff manufactory 200m south-east have the potential to impact the site due to the nature and proximity of some of these sources. The potential

contaminants for the above off-site sources include heavy metals, asbestos, hydrocarbons (PAHs and TPH), pH adjustors, PCBs, organics, inorganics, BTEX, MTBE, acidity, VOCs, SVOCs, vapours and ground gases (methane and carbon dioxide).

6.2.2. Potential Pathways

The potential receptors identified for the site as part of this assessment include the following:

- Direct human contact:
- Inhalation (on site and of windblown dusts);
- Ingestion
- Direct contact with aggressive ground conditions;
- Leaching and migration via groundwater and surface water; and
- Migration of ground gas and vapours via permeable soils (Made Ground present on site and underlying natural strata).

6.2.3. Potential Receptors

The potential receptors identified for the site as part of this assessment include the following:

- Site end users (residents, commercial and hotel staff, site visitors and neighbours);
- Groundworkers (construction and future maintenance workers);
- Building materials (buried concrete and underground services); and
- Controlled waters: Groundwater (Lynch Hill Gravel Member Secondary A Aquifer) and surface water (surface water run-off and overland flow).

6.2.4. Summary of Source-Pathway-Receptor Contaminant Linkages

The information gathered in this assessment has been compiled to produce a summary of the source-pathway-receptor contaminant linkages and is presented in Table 6.1.

It should be noted that the risk posed to groundworkers (construction and future maintenance workers) has not been assessed further in this assessment, as any risks are considered to be mitigated through good site practice and health and safety precautions, such as dust suppression and the use of Personal Protective Equipment (PPE).

Some viable migration and exposure pathways and potential pollutant linkages have been identified at the site. The following is a summary of viable, site specific pathways and pollutant linkages to be considered:

- Hazardous ground gases, potentially generated by the Made Ground, any fuel or power infrastructure or organic-rich natural soils, may migrate into above and below ground structures and accumulate within building voids and enclosed spaces (with a resultant risk of asphyxiation and / or explosion). The potential for exposure of human health receptors (residents, commercial and hotel staff, site visitors and neighbours) using the proposed development is moderate due to the existing tanking / waterproofing of the existing basement on site (which is intended to be retained) and the future tanking / waterproofing of the new basement areas on site. Depending on the nature and thickness of the Made Ground on site, ground gas and vapour protection measures and appropriate ventilation may be required.
- Inhalation of toxic vapours, potentially migrating into above and below ground structures from contaminants within the Made Ground, contaminated groundwater or historic / contemporary localised spills or leaks identified from existing tanks, fuel apparatus, generators or other plant and former uses of the site for parking etc. on site.
- Shallow soil contamination has the potential to vertically migrate downwards into the underlying natural soils and any perched or shallow groundwater by leaching and infiltration. The hardstanding and building footprints on site will reduce infiltration potential and leaching rates, which results in a lower mobility of shallow contamination. The retention of most of the existing buildings on site will also reduce the potential for infiltration on site during the construction and redevelopment phases of the project.

- Lateral migration of site-borne contaminants to off-site receptors (down hydraulic gradient), including adjacent land and surface water (via surface water runoff and baseflow).
- Lateral migration of potentially contaminated shallow groundwater from off-site areas (up hydraulic gradient), impacting on-site groundwater.
- Below ground concrete structures and foundations are susceptible to chemical attack from aggressive ground conditions (pH and water-soluble sulphate).
- Potable water pipes are susceptible to chemical attack from shallow soil contamination.

 Fable 6.1
 Source-pathway-receptor linkages

Potential Site Contaminant Sources	Potential Pathways	Potential Receptors	Potential for Complete Pathway	Risk Level Classification
On Site	Direct human contact		No	
Made Ground Potential asbestos- containing materials	Inhalation on site and of windblown dust	-	No	
Historical and contemporary	Ingestion	-	No	
infrastructure including tanks, any fuel apparatus, generators or other plant	Direct contact with aggressive ground conditions	Current site users (disused site)	No	
Historical activities the schools, colleges, theatre, fire engine	Leaching and migration via groundwater and surface water		No	
station, plumber shops, silk dressers, church, a garage, car	shops, silk dressers,		No	
		No		
Off-site Nearby historical land uses including the	Direct human contact		No (if there is no soft landscaping in final development)	
former tramlines, former electrical sub- station, sunk petrol tank 75m south-east,	Inhalation on site and of windblown dust		Yes	Low
blacking works 100m south-east, garage 100m east and tobacco and snuff	Ingestion	Future site users (future commercial tenants and	No (if there is no soft landscaping in final development)	
manufactory 200m Contemporary sources including nearby dry	Direct contact with aggressive ground conditions	site visitors)	No	
cleaners and photographic processors	Leaching and migration via groundwater and surface water	-	Yes	Low
	Ground gas and vapour migration via permeable soils	-	Yes	Moderate

Potential Site Contaminant Sources	Potential Pathways	Potential Receptors	Potential for Complete Pathway	Risk Level Classification
Potential contaminants of	Direct human contact		No	
concern Heavy metals, asbestos, PAHs, TPH,	Migration of contaminants: non-aqueous phase	Services	No	
VOCs, SVOCs, BTEX, MTBE, acidity, pH adjustors, inorganics,	Migration of contaminants: aqueous phase		No	
phenols, elevated sulphate, vapours and ground gases (methane, carbon	Migration of contaminants off-site: non- aqueous phase		No	
dioxide and hydrocarbons).	Migration of contaminants off site: aqueous phase	Adjacent Properties	No	
	Ground gas and vapour migration via permeable soils		No	
	Inhalation of wind-blown dust	Ecological Impacts	No	
	Migration of contaminants: non-aqueous phase		No	
	Migration of contaminants: aqueous phase		No	
	Migration of contaminants from site: non- aqueous phase		Yes	Low (due to reduced infiltration on site)
	Migration of contaminants from site: aqueous phase	Secondary A Aquifer groundwater	Yes	Low (due to reduced infiltration on site)
	Migration of contaminants from off-site onto the site: aqueous phase		Yes	Low
	Migration of contaminants via aquifer: non-aqueous phase	Surface water	Yes	Low
	Migration of contaminants via aquifer: aqueous phase	Surface Water	Yes	Low

The Preliminary Contamination Risk Assessment has identified complete Contaminant-Pathway-Receptor (CPR) linkages with a maximum **moderate** risk level from the potential contamination sources risk drivers identified on the site and in the surrounding area.

The most significant of these potential source drivers, which have the potential to impact the proposed future residents, commercial and hotel staff, site visitors and neighbours are the potential for a substantial thickness of Made Ground (assumed to be up to 3m thick), historical and contemporary contamination beneath the site including any contamination associated with existing tanks, fuel apparatus, generators or other plant on site, the ground gas and vapour risks from the Made Ground and underlying natural strata and asbestos-

containing materials within the existing buildings on site. It is considered as a worst-case scenario that the in-situ Made Ground on site may contain the following contaminants: heavy metals, asbestos, PAHs, TPH, VOCs, SVOCs, BTEX, MTBE, acidity, pH adjustors, inorganics, phenols, elevated sulphate, vapours and ground gases (methane, carbon dioxide and hydrocarbons).

It is recommended that prior to any demolition or refurbishment works on site that an asbestos survey is undertaken within all of the buildings and structures on site to determine the presence of asbestos-containing materials. If present, removal works will need to be undertaken by a specialist contractor prior to the demolition phase, in accordance with the Control of Asbestos Regulations (CAR 2012).

The fairly limited number of historical industrial and commercial operations in the surrounding area pose a limited risk to the site due the nature of these operations and / or their distance from the site boundary.

It should be noted that the presence of a basement across a large area of the site is likely to have displaced some of the original Made Ground dating back to the original phases of construction and demolition works at the site. The excavation of additional basements and basement levels across the site will further remove residual Made Ground on site and result in overall site betterment.

It will be essential that the retained basement, and the new basement levels on site are appropriately tanked / waterproofed with ventilation measures in place. The requirement for ground gas measures at the site will be dependent on the findings of a future ground investigation.

Contemporary sources, given the nature and scale of these operations, due to modern environmental controls and permitting and the absence of any recorded incidents or spills within 550m of the site are not considered to pose a significant risk to the site.

Historical land uses including the adjacent tramlines, the former electrical sub-station to the south of the site and other off-site sources have the potential to impact the site. The potential contaminants of concern include heavy metals, asbestos, hydrocarbons (PAHs and TPH), pH adjustors, PCBs, organics, inorganics, BTEX, MTBE, acidity, VOCs, SVOCs, vapours and ground gases (methane and carbon dioxide).

Any human health exposure to Made Ground on site will be short-term due to the proposed presence of site-wide building footprints and hardstanding and the refurbishment, as oppose to demolition of a large number of the buildings on site. Risks to controlled waters and services from the Made Ground on site will be mitigated by the presence of a sitewide building footprint and perimeter hardstanding, which will limit infiltration and vertical and lateral migration. Surface water runoff will be collected by new drainage systems installed as part of the proposed redevelopment scheme. As a result, the risks to human health, controlled waters and potable water utilities from on-site Made Ground will be limited due to the absence of soft landscaping areas on site and a viable contaminant pathway to impact site users within the final development.

Whilst the near surface Superficial Aquifer is reasonably transmissive, the presence of hardstanding will limit the potential for human health receptors to be impacted by contamination migrating onto the site.

6.3. Preliminary Contaminated Land Ground Investigation Scope

Given the discussion in Section 6.2.4, to prevent *Significant Possibility of Significant Harm* from potential contamination sources to the proposed future residents, commercial and hotel tenants, site visitors and neighbours, it is recommended that any asbestos-containing materials identified during the asbestos survey be removed prior to any demolition or refurbishment works to prevent the generation of asbestos fibre dust.

In addition, to confirm the geo-environmental risks to receptors and to confirm the ground conditions an appropriate intrusive ground investigation is recommended on site. The risks are considered to be **moderate**, and confirmation of the ground conditions and contamination status of the shallow soils is required. Due to the nature of the proposed development, the site history comprising potentially contaminative operations and the location of the site on a Secondary A Aquifer, detailed ground investigation and risk assessment is considered essential. Samples of the near-surface soils should be collected and analysed to determine the presence or confirm the

absence of contamination on site. This should be carried out following any proposed demolition works on site to ensure the new areas of the site to be developed can be investigated.

Based on the current available data, the investigation is anticipated to comprise:

- Dynamic (window) sampling and trial pitting across the site to facilitate the collection of soil samples for geo-environmental purposes;
- · Geo-environmental chemical contamination analyses of soils and groundwater (if encountered); and
- Ground gas, vapour and groundwater monitoring wells to be installed on site and monitored on a minimum of six occasions to confirm the absence of a ground gas risk on site. This should be carried out in accordance with relevant NHBC Guidance, the CIRIA Report C665: Assessing Risks Posed by Hazardous Ground Gases to Buildings: A Guide to Good Practice (*Wilson et al 2007*) and the British Standard 8576:2013. A photoionization detector (PID) is to be used to record any vapours with the monitoring wells.

In addition, as part of the ground investigation, any residual tanks, fuel apparatus, generators or other plant must be investigated, decommissioned as required and removed from the site by a licensed contractor.

Further to this, should any contamination be identified during any future groundworks at the site, then a suitably qualified and experienced geo-environmental engineer should be consulted and if necessary further assessment should be carried out as appropriate.

7. Geotechnical Design and Construction

7.1. Standards and Codes of Practice

The design of ground works and substructure components should be carried out in accordance with (but not limited to) the following standards and codes of practice:

Permanent Works:

- BS EN 1990:2002 Eurocode Basis of Structural Design.
- BS EN 1991 (all Parts) Eurocode 1: Actions on Structures.
- BS EN 1997-1:2004+A1:2013 Eurocode 7: Geotechnical Design Part 1: General Rules.
- BS 8004:2015 Code of Practice for Foundations.
- BS 8002:2015 Code of Practice for Earth Retaining Structures.
- BS 6031:2015 Code of Practice for Earthworks.
- BS 8102:2009 Code of Practice for Protection of Below Ground Structures Against Water from the Ground.
- LDSA:2017 Guidance notes for the design of straight shafted bored piles in London Clay.

Temporary Works:

- PAS 8811:2017 Code of Practice for Temporary Works.
- PAS 8812:2016 Guide to The Application of European Standards in Temporary Works Design.
- BS 5975: Code of Practice for Temporary Works Procedures and the Permissible Stress Design of Falsework.
- Temporary Works Forum Guidance Notes.

Ground Investigation:

- BS EN 1997-2:2007 Eurocode 7: Geotechnical Design Part 2: Ground Investigation and Testing (with Corrigendum 2010).
- BS 5930:2015 Code of Practice for Site Investigation.
- British Standards Suite and Industry Best Practice Relating to Geotechnical Laboratory Testing.

Other References and Guidance Documents:

- CIRIA C760 Guidance on Embedded Retaining Wall Design.
- CIRIA C583 Engineering in the Lambeth Group.

7.2. Preliminary Foundation Load Estimates

To facilitate the discussion on potential foundation options and to enable the development of concept design solutions, approximate foundation loads have been estimated.

The proposed hotel will have building heights ranging from seven to fourteen storeys while the residential development will have a building height of ten storeys, as shown in Figure 5.1. Approximate building loads for individual columns are presented in Table 7.1 based on an assumed surcharge of ~12kPa per storey and column tributary area of 42m² (assumed 6.5m representative spacing between supports).

The approximate building loads specified in Table 7.1 have been evaluated for the preliminary assessment of foundation solutions only (in order to gauge general magnitude of forces and to aid the evaluation of foundation options).

No horizontal or tension loading has been considered in the preliminary foundation load estimates.

able 7.1 Preliminary working foundation column loads for the proposed development

Building Zone	No. of Storeys	Preliminary Surcharge (kPa)	Approximate Column Loading (kN)
Hotel	7	85	3,570
Hotel	9	110	4,620
Hotel / Residential Block	10	120	5,040
Hotel	12	145	6,090
Hotel	14	170	7,140

7.3. Ground Engineering Works

Ground engineering works for the proposed scheme will include (but may not be limited to) earthworks, earth retention systems (including groundwater control / cut off) and shallow / deep foundation requirements.

The outline proposals discussed in this section should be revisited upon receipt of the following:

- Results of site-specific ground investigation, laboratory testing and field monitoring.
- More accurate foundation loads arising from further design development.
- Scheme design substructure proposals.
- Information relating to the existing building substructure (including current foundations schemes and coordination between any
 existing and proposed underground structures)

7.3.1. Earthworks

Earthworks related to the proposed development include the extension of the existing one-level basement occupying the eastern sections of the site to a three-level basement with average depth to formation level of approximately 13.5m. Based on the preliminary ground model, the material excavated will likely comprise Made Ground, Lynch Hill Gravels, and London Clay Formation.

The composition of uncontrolled fill / Made Ground is highly variable and no site-specific information is available for the materials concerned. It is not known if any of the excavated Made Ground would be suitable for reuse on the site, however this is considered to be unlikely. The Lynch Hill Gravels and London Clay may yield some reusable gravels, sands, silts and clays, however further site-specific testing would be required in order to confirm this.

The earthworks strategy will need to consider the groundwater regime described in Section 3.7. Requirements for groundwater cut-off are outlined in Section 7.3.2. Regardless of any achieved cut-off by means of an embedded wall, groundwater management will need to be considered as part of the earthworks strategy and appropriate dewatering for the water confined within any excavations.

If/where shallow foundation systems are adopted, which are reliant on the immediate formation level subgrade, the earthworks should be specified accordingly, taking cognisance of any subgrade protection / blinding requirements in order to prevent the deterioration of the formation due to environmental conditions and operational activity on site.

7.3.2. Earth Retention and Groundwater Cut-Off

Key considerations have been presented herein in order to cater for the substructure design development that includes the deepening of existing basement in the eastern sections of the site and the reuse of the existing Lethaby Building basement.

7.3.2.1. Groundwater Cut-Off Requirements

Excavations above the short-term groundwater table at 3.0mBGL will likely not require significant dewatering, although perched groundwater within superficial cohesionless materials may be encountered at shallower depths.

The proposed basement deepening will require a full groundwater cut-off as some areas of the current basement formation are likely to be located within the relatively permeable superficial strata, and the proposed excavation extends below the short-term groundwater table. An embedment of any proposed retaining structures at least two metres into the London Clay is likely to be sufficient to achieve groundwater cut-off for the new basement excavation. The low permeability of the clay will restrict the inflow of water into the excavation in the short-term. Dewatering within the excavation may proceed within the confines of the excavation by sumps and pumps (or another suitable alternative). The retaining wall cut-off will prevent drawdown of the water table surrounding the site and mitigate the associated risk of ground settlement.

It is noted that any retaining wall cut-off will create an impermeable barrier within the Secondary A Aquifer (Lynch Hill Gravels). It is envisaged that this will result in some impact on the hydrogeological regime and perched water table condition (i.e. in the form of a potential localised rise/fall in the ground water levels within the near surface aquifer). The proposed basement will also interact with adjoining substructures and embedded wall obstructions. The global effect on the near surface aquifer will be reviewed during design development, as part of the scheme Basement Impact Assessment (BIA).

7.3.2.2. Proposed Earth Retention Systems

At the time of writing this report, the excavation retention solution for the proposed basement deepening has not yet been finalised. Considering that the proposed basement excavation will extend through the Lynch Hill Gravels and into the London Clay, potentially below any perched groundwater tables within these materials, a secant or sheet pile wall may be considered as a means of earth retention for the development to achieve the required groundwater cut-off. A hybrid secant / contiguous pile wall solution may be considered beneath the required groundwater cut-off depths; however, the risks associated with groundwater and the transition between the secant and contiguous walls will require review following site-specific ground investigation works.

Underpinning may be considered for the excavation adjacent to the Lethaby building – subject to review of the viability of such a solution based on the envisaged excavation depths. In addition, the viability of underpinning is subject to the short-term groundwater conditions, and this retention solution will be likely unfeasible within the Lynch Hill Gravels below the short-term groundwater table without significant dewatering. Where underpins are to be installed, the local excavations should be spaced appropriately to avoid undermining large sections of the structures to be underpinned (i.e. the contractor should develop an appropriate works sequence – and corresponding method statements – which effectively safeguards the Lethaby Building). It is noted that the applicability of this construction method may be limited, due to the depth of the proposed scheme excavation works.

The presence of sensitive structures within close proximity of the site (e.g. Thames Water assets, underground infrastructure, electricity cables, building façades) means that excessive lateral ground movements due to basement excavation should be avoided. Typical pile wall lengths would be of the order of 1.5 to 2 times the retained height, assuming no significant axial loads are applied and/or the earth retention system would be propped/braced in an appropriate fashion.

Sheet piles may be considered as a means of forming any additional excavations (depending on construction sequence and proposed logistics constraints). Jetting or predrilling may be required in order to achieve any significant penetration through the gravels and into the stiff London Clay Formation. Appropriate care would be required during construction to ensure that the installation effects do not introduce excessive ground movements and potential impact on surrounding structures and assets, as well as any adverse effects on existing foundation elements. The viability of this method would need to be reviewed with caution considering installation limitations and constraints within the congested below ground settings concerned.

A secant pile wall would be favoured due to the flexibility in achieving greater depth of penetration and an embedded structure of greater flexural rigidity. As per the sheet piling considerations outlined above, installation effects, interlock between primary and secondary piles and construction tolerances will need to be considered accordingly when specifying this system.

If the embedded retaining wall is required to resist significant axial loading, a sheet pile wall may not be suitable due to the relatively limited depth of embedment which may be achieved using silent piling hydraulic push-in techniques. A secant or contiguous pile wall can be used to support more significant axial loads, by increasing the length of the piles local to any given column position. The capping beam provision and design will govern load distribution and the number of piles which may be mobilised to resist any axial loading.

The interface between any proposed embedded retaining systems and existing earth retention structures will need to be reviewed and coordinated following the ground investigation, as this will inherently have an impact on construction sequencing, temporary works, propping and bracing solutions, and selection of an appropriate retention system.

A ground movement and impact assessment should be carried out in due course in order to confirm that the adopted means of earth retention and associated temporary works will not result in excessive ground movements that would damage existing buildings or third-party infrastructure. This aspect is discussed in greater detail in Section 7.6.

7.3.3. Foundation Requirements

The potential foundation system options for the proposed development have been reviewed with reference to the potential degree of net unloading and loading representative of the proposed Cochrane Theatre demolition, basement extension, and tower construction / redevelopment.

In view of the low permeability of the London Clay Formation and Lambeth Group clays underlying the site, the performance of the foundation system may be time-dependent, subject to the zone of influence of the adopted foundation system (where long-term heave or consolidation related settlement will need to be evaluated alongside any short-term analysis scenarios).

For this preliminary design stage, a short-term water table level at +22.0mOD (3.0mBGL) has been used to determine the heave pressures, and the long-term water table at +24.0mOD (1.0mBGL) has been used to calculate the uplift pressures.

7.3.3.1. Net Loading Considerations

The excavation of the basement extension/deepening in the eastern portion of the site will remove approximately 9.5m (180kPa) of overburden. This overburden removal will induce negative excess pore water pressures (suctions) within the underlying cohesive soil mass. The excess pore water pressure field will then dissipate with time, resulting in heave movements, which may correspond to approximately 50% of the effective overburden pressure removed (taking into consideration a degree of partial consolidation during construction).

On the basis of the above, this overburden removal may result in maximum heave pressures in the order of 50kPa to 60kPa. This time-dependent heave is not a permanently destabilising load but will need to be mitigated by the proposed substructure / foundation system.

Heave pressure can be mitigated in part with the use of a proprietary heave mitigation layer, such as a Cordek Cellcore product or equivalent. The product is designed to resist the wet concrete pressure with an appropriate safety margin, beyond which it will crush under increase in heave pressure in the long-term condition. This would limit the pressure applied to any suspended slabs which span between pile foundations or discrete footings, should such options be adopted. This option would not be applicable should a monolithic ground bearing raft foundation be adopted.

Given the presence of below-ground space throughout the site, a UPL stability assessment will likely need to be undertaken in addition to GEO and STR verification to Eurocode 7. Partial factors γ_G of 1.1 and 0.9 can be adopted for unfavourable (water) and favourable (building) permanent loading respectively, as appropriate (and γ_O of 1.5 and 0.0 for unfavourable and favourable variable loading, respectively).

For the new basement structure, the groundwater cut-off into the low permeability London Clay Formation will prevent the development of significant short-term uplift pressures, and the long-term uplift would amount to an approximate maximum pressure of the order of 120kPa (based on a ground water table at 1mBGL). This aspect of the design development may be refined further, following site specific GI works, which prove the existing water table elevation, over a suitable monitoring period.

Depending on the final massing (and adopted foundation solutions) for the development, stabilising pressures ranging from 85kPa to 170kPa from permanent structural loading may act across the new basement foundation footprint. In this scenario the substructure will experience a net long-term permanent destabilising pressure of approximately 35kPa or a stabilising pressure of 50kPa.

It is recommended that a detailed UPL assessment is undertaken as the scheme progresses, in order to determine the need (if any) for groundwater uplift mitigation measures.

In order to mitigate any net destabilising conditions that arise, two primary options can be considered:

- Active means of mitigation, in the form of an underdrainage system, which relieves the water pressure acting on the underside of the substructure. This system would comprise a granular engineered blanket with a network of drainage pipes and sumps. Groundwater would be pumped in order to maintain a zero-pressure condition. The volumes of groundwater inflow would be limited due to the penetration of the embedded wall into the London Clay Formation. This solution potentially reduces the foundation requirements for uplift control; however, the whole-life cost of the underdrainage system needs to be considered alongside ongoing maintenance provision. The merits of this option can be reviewed on the basis of proposed basement grade and potential interface with any other drained cavity provision along the retaining wall site boundary.
- Passive means of mitigation, in the form of tension piles or anchorage, which provides further restoring force and ensures satisfactory equilibrium (EQU and UPL condition) criteria are met. This option is provided as part of the substructure and does not require any further consideration throughout the life of the structure. It is noted that any compression piles may perform this function over the design life of the structure, however time dependent behaviour, corresponding net loading, and reinforcement provision will need to be reviewed accordingly.

It is noted that the content and recommendations presented within this section are dependent on the current development scheme, and the considerations and values presented herein should be re-evaluated as the scheme evolves.

7.3.3.2. Foundation Re-use Considerations

It is understood at this stage that foundation reuse may be required as part of the proposed development. The interface between existing structure foundations, and the proposed excavation works, will need to be reviewed in detail. This aspect of the design development is considered critical, in order to ensure adequate support for retained structures is maintained during all phases of the works.

The foundation capacity associated with the existing foundation systems will need to be reviewed in detail as part of design development, if there is any intent to re-use existing foundation elements to support the proposed development. This review will require a holistic assessment of the existing foundation typology and geotechnical / structural capacity of any potential existing footings/rafts or piles, along with the loading imposed by the proposed scheme.

It is likely that any existing raft foundation satisfies Eurocode 7 ULS criteria due to the overburden removal from previous basement excavation, net loading criteria, and breadth / significant footprint and zone of influence of the development. The changes in loading from the proposed works and additional storeys are unlikely to exceed local / global ULS criteria subject to robust substructure detailing and evaluation of soil-structure interaction effects. The temporary condition will need to be analysed in detail once outline proposals are developed in order to evaluate the impact of localised loss of bearing within areas where the existing basement slab / raft will be removed.

Serviceability limit state (SLS) drivers will govern any raft design (if such a solution is adopted), particularly with regards to differential movements and the impact on surrounding sensitive structures / assets.

Any pad / strip foundations which are to be reused must be assessed for ULS capacity and degree of current utilisation, in order to determine any requirement for strengthening due to increased loads. Provided ULS conditions are satisfied, SLS performance will govern. Any increase in foundation loading will be subject to additional settlements which should be reviewed in order to ensure excessive movements / rotations between supports are avoided.

The review of foundation capacities associated with any potential existing deep piled foundation systems should consider the following:

- Evaluation of the pile reuse load factor (R), which is given as the ratio of the new foundation loading requirement (N_{new}) over the historic foundation working capacity (N_{his}), i.e. $R = N_{new} / N_{his}$.
- Pile re-use load factor (R_o) can be evaluated where (N_{his}) is based on original calculations.
- Pile re-use load factor (R_c) can be evaluated where (N_{his}) is based on current design theory and approach.
- Pile re-use load factor (Rt) can be evaluated where (Nhis) is based on a detailed load take-down of the existing building.
- Pile re-use load factor (Rp) can be evaluated where (Nhis) is based on representative pile load testing.

It is noted that pile capacity can increase over time for a variety of reasons and as a result of various potential mechanisms (as identified in the RuFUS, CIRIA and other published guidance on pile reuse), however exceedance of current loading by any margin greater than 10-25% will require careful consideration, detailed analysis/verification and representative testing.

In order to support the preliminary analysis outlined above, it will be necessary to confirm the performance of the current foundation system to date. It is therefore recommended that a structural inspection of the existing building be undertaken with a view of confirming that the existing foundations have performed adequately throughout their design-life (on the basis of a visual inspection by an experienced engineer).

The design team will be required to prepare a Technical Pile Reuse Strategy Report in order to inform the design process and to support potential asset protection review processes and Building Control submissions.

7.3.3.3. New-Build Foundation Options

At this stage it is understood that the majority of the substructure and basement formation for the proposed new development will be founded within the London Clay Formation.

A monolithic raft system will likely be viable from an ultimate limit state (ULS) point of view if founded on the London Clay Formation. Serviceability limit state (SLS) drivers will govern the design of the raft, particularly when considering absolute / differential settlements and any impact on the surrounding sensitive listed structures and assets (such as the Lethaby Building and the Crossrail tunnel running near the site's southern boundary). Accounting for the surrounding sensitive structures, it is likely that the movement predictions from ground movement assessments of the surrounding buildings, underground structures, and utilities will govern the allowable vertical movement of a raft foundation system. A typical differential settlement gradient tolerance is 1_{vertical}:500_{horizontal}, however, this indicative threshold is subject to the requirements of the project team and relevant engineering disciplines.

A hybrid foundation system, in the form of a piled raft, may also be considered in the instance where ULS criteria are satisfied but SLS performances thresholds are not met. This system would comprise the introduction of piles to aid the serviceability performance of a raft foundation.

If a pile foundation system or a hybrid piled raft is selected due to increased levels of loading and/or desire for tight control on ground movements, pile construction methods that would suit the proposed site and surrounding environs include continuous flight auger (CFA) and rotary bored piles.

CFA piles will enable foundation construction without the use of temporary support / steel casings or support fluids within deeper sand horizons (such as that which can be encountered with the Lambeth Group), which would normally be required when drilling below the water table in cohesionless soils using traditional rotary methods. This type of pile is typically limited to approximately 25-30m in length

from the piling platform level and typically cannot be used to form piles larger than approximately 1.2m in diameter. Selected contractors have the capability to construct longer piles (in excess of 30m), however this may reduce the number of competitors within the supply chain, which may adversely affect project procurement in due course. Rotary bored piles can be considered if/where a larger diameter solution is required, or longer piles are desirable, taking cognisance of site access / restrictions. Depending on when the piles are installed and whether the existing floor slabs within Red Lion Square and Central St Martins Bridge Link and Innovation Centre are to be demolished as part of the works, the working space (headroom restrictions) for any piling works may be limited. In such a scenario it is likely that restricted headroom rigs will be required.

New pile foundations are likely to be formed within the London Clay Formation and Lambeth Group. As such, they can be installed in 'dry' conditions without the need for drilling under support fluid (bentonite slurry / polymer) to support the borehole. Pile foundations consisting of single piles or pile groups may be considered to support discrete columns or more substantial stability elements within the proposed block footprints.

Piles with embedded lengths greater than approximately 25m are assumed to be constructed using rotary drilling methods. All diameters are shown as tool / auger diameters, where rotary bored piles are considered, a larger temporary casing will be adopted to prevent bore instability within the superficial deposits.

Figure 7.1 provides estimated equivalent working loads for a range of relevant pile diameters and embedment lengths, which have been evaluated on the basis of the data arising from the desk-based review. It is assumed that the piles will cut off at the basement formation level (approximated for the purpose of this study to be at +11.50mOD).

The preliminary working loads are based on an outline assessment in accordance with Eurocode 7 and BS 8004:2015 design criteria. These should be revisited and refined accordingly once site-specific ground investigation information becomes available. The pile diameters presented are tool diameters.

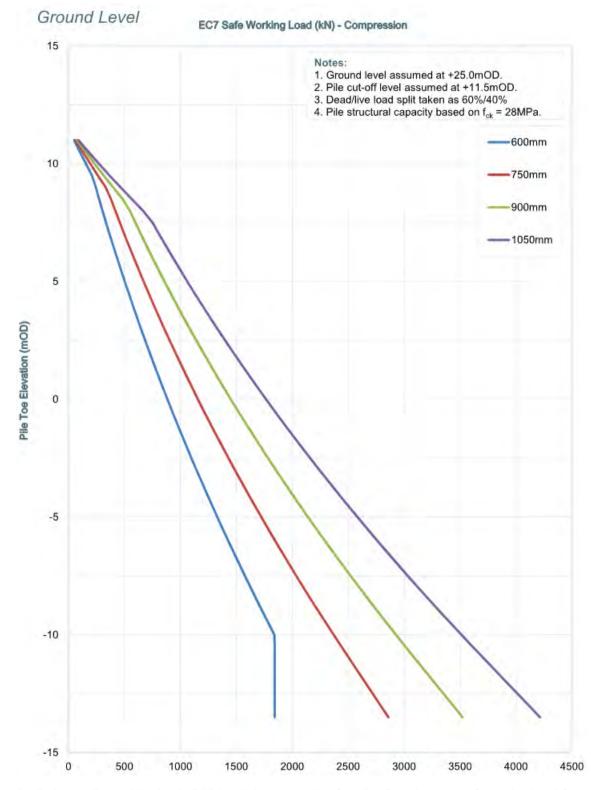

Figure 7.1 Preliminary pile working loads (kN) in axial compression for piles from basement formation level for selcted pile diameters

7.4. Construction Considerations

Beyond earth retention system proposals to form potential basement levels or below-ground space, temporary shoring may be required to facilitate excavation for pile caps, manholes, sumps and other below ground structures. Trench sheets and hydraulic or mechanical jacks may be suitable to shore small excavations in cohesionless soils, such as the superficial deposits underlying the site.

For preliminary considerations, temporary batter slopes in cohesionless soils should be excavated no steeper than 1_{vertical}:1.5_{horizontal}. Lower batter slope gradients should be adopted if the top of the slope will be surcharged e.g. with plant, equipment, traffic, foundations or similar. It is considered that the near-surface / existing subgrade materials should be readily excavated by standard means and methods.

Approvals may need to be sought for dewatering and discharge. An appropriate provision should be allowed for to account for disposal charges. The unit rate to dispose of groundwater will depend on the local water utility authority and whether the discharged ground water is contaminated. Similarly, other construction operations (including but not limited to pile installation if / where necessary) may require appropriate submissions and compliance with design and construction assurance procedures, which would need to be discharged by the project team.

A working platform will be required to enable safe operation of any piling or other plant during construction (designed in general accordance with BRE BR 470 methodology and industry best practice). A preliminary build-up may comprise 600mm thickness of 6F2 fill or equivalent and a single layer of biaxial geogrid and separation geotextile. The actual build-up of the working platform will depend on proposed piling platform elevation, the size of the piling rig and mobile cranes, and the quality of the in-situ subgrade upon which it will be constructed. The working platform will require conformance testing, by means of plate load tests (or other method, as required by the platform designer). 6F2 fill used for construction of the platform should have less than 10% fines and those fines should be of low plasticity.

The choice of pile diameter and length may be influenced by the piling rig working space available. It is likely that there will be piling operations prior to the demolition of the existing basement slabs, hence rig access conditions should be reviewed accordingly. Typical mini piling rigs available across the supply chain, which would be adopted for confined working conditions, are less capable of overcoming obstructions (such as concrete / existing rafts etc.) and the pile diameters and lengths are limited to up to 600mm and 20-25m, respectively. Specialist mini piling rigs are generally capable of dealing with obstructions and installing larger piles, but this will also have an impact on the potential scale of required demolition / enabling works, and would inherently limit the available supply chain.

In addition, an array of smaller piles, installed by a mini piling rig, will be more resilient to changes in pile position required as a result of obstructions – from a substructure design perspective – whereas re-positioning of larger diameter piles can have a large knock-on effect on substructure proposals (i.e. column load transfer to piles). It is recommended that guidance is sought from the appointed main contractor in relation to their supply chain (and specialist piling contractors) in order to ensure that any selected pile diameters and lengths are in line with their capabilities. The pile capacities presented in this document will be updated / revised to suit the scheme intent, as required.

7.5. Construction and Design Risks

Key design and construction risks associated with ground engineering works identified at this stage include:

- The existing foundation systems of the structures currently present on site are unknown. An investigation of the type and extent of the existing foundations will be required as the design of the proposed development continues.
- Aside from ULS and SLS foundation design drivers, the viability of selected earth retention and foundation solutions may be dependent on interaction with the existing substructure, adjacent third party assets and below-ground structures.
- The site is likely to be covered by a layer of uncontrolled fill / Made Ground. This material will be heterogeneous and will have been placed in an ad-hoc manner and with little control over its engineering properties. It may contain inert/hazardous waste and other deleterious materials. It should not be relied upon as a foundation soil for engineering purposes. It should be risk assessed and waste classification testing must be carried in order out to identify disposal requirements.

- Due to the age of the existing structures on site, dating back to the 1900s, there is potential for asbestos-containing materials to be present within the existing fabric (internal fittings, pipe lagging and potentially in roofing materials).
- Although the site has undergone significant redevelopment and excavation following the end of WWII, the hazard associated with the presence of UXO during any excavations and pile construction must be managed effectively, as recommended herein.
- Approval from the Environment Agency may be required for works such as piling using a support fluid (e.g. bentonite or polymer).
 Other construction issues associated with dewatering and disposal of groundwater may also require approval and permitting. Any drilling or piling works which may establish connectivity between any superficial perched groundwater and the aquifer at depth (by penetrating the London Clay Formations and cohesive Lambeth Group, which forms an aquiclude) will require appropriate consideration and stakeholder approval.
- The construction of the new basement will form a full groundwater cut off to any groundwater flow regime present in the superficial deposits. The impact of this change to the local hydrogeological conditions will require further review as the scheme progresses, in order to ensure no adverse impact to surrounding structures / assets.

7.6. Third Party Asset Protection

A ground movement assessment (GMA) will be required to assist with planning approvals, Party Wall liaison and to facilitate detailed design of the proposed scheme. The ground movement assessment would evaluate the displacement of the soil surrounding the proposed development site and the associated impact of that movement on existing structures and infrastructure/utilities.

Based on previous experience on comparable projects in similar settings, the following items are generally required to be assessed:

- Risk of damage to existing buildings due to ground movements associated with construction and operation of the proposed building is generally submitted to the Local Authority for review of planning consent. The assessment of risk to buildings is usually based on Burland's Damage Scale. The development site is located within the London Borough of Camden and planning approval will only be discharged if it can be demonstrated that the risk of damage to surrounding buildings does not exceed Category 1 Very Slight. It is also common for Party Wall reviewers and representatives to request Category 1 as a threshold.
- Ground movements may also impact buried services/utilities/tunnels and surrounding roads and infrastructure. This facet will require review once proposals are established and coordinated with existing assets.

It is recommended that asset protection teams for the various utility/infrastructure owners are engaged early in the project design life. Asset owners, such as Thames Water, London Underground Limited, and Royal Mail, will require a relatively detailed assessment of the impact of ground movement on their assets, in particular for Victorian-era brick masonry sewers present underneath the roads adjacent to the site. The asset protection teams will generally define the performance limits that must not be exceeded for their assets.

Furthermore, it has been noted that the scheme proposals may result in a full groundwater cut – off to any existing flow regime. This aspect should be reviewed in greater depth as the scheme progresses, to determine the impact on adjacent buildings / underground structures. It is recommended that the project team undertakes further archive review of adjacent buildings / adjoining basements in order to determine the likely impact of this facet. This review will also inform the potential scope of the overarching scheme BIA and any potential requirement for hydrogeological numerical simulation/modelling.

8. Outline Ground Investigation Scope

8.1. Investigation Context

The ground investigation will form an integral part of the planning and design process moving forward. It is noted that the London Borough of Camden may request that a site-specific ground investigation be included within the planning submission for schemes where shallow foundations are proposed.

The ground investigation will be required to inform the following aspects, amongst others, throughout the design and construction project life-cycle:

- Development of a site-specific ground model.
- Evaluation and selection of geotechnical parameters for foundation and earth retention system design (in order to inform both temporary and permanent works design requirements).
- Groundwater regime assessment to inform foundation design, construction methodology, basement design and waterproofing requirements, etc.
- Geotechnical parameters for numerical modelling of soil-structure interaction and preparation of ground movement and utility/infrastructure/building damage assessments.
- Presence of potential geotechnical hazards at the development site, e.g. ground model anomalies, weak superficial deposits and similar
- The presence of potentially contaminated Made Ground and disposal requirements.
- Groundwater quality and gas assessment.
- Civils / drainage intrusive investigations.

8.2. Preliminary Investigation Scope

A preliminary investigation scope has been developed on the basis of the below ground engineering requirements arising from the desk-based review. The envisaged geotechnical and geo-environmental related scope may include the following elements of investigation and testing:

On-Site Works / Fieldwork

- Two boreholes to a depth between approximately 25m to 30m from basement level into the Lambeth Group in order to characterise the geotechnical strength profile at depth beneath the new basement. Drilling technique and sampling methodology to suit site logistics and meet requirements set out in the relevant sections of Eurocode 7.
- Dynamic (window) sampling across the site to facilitate the collection of soil samples and groundwater/gas monitoring for geotechnical profiling and geo-environmental purposes.
- In-situ testing in the form of Standard Penetration Testing. Advanced in-situ testing may be considered, depending on the relative complexity of substructure proposals developed during concept design. This may include self-boring pressuremeter testing in order to assess the in-situ stress condition and to evaluate stiffness parameters for the London Clay Formation and Lambeth Group.
- Trial pits for geotechnical and structural investigation purposes (including but not limited to geotechnical profiling, geo-environmental sampling, investigation of existing substructure and foundation system, site boundary conditions, potential obstructions and hardstanding details).
- Groundwater monitoring to meet substructure design requirements as appropriate (and to establish the groundwater table and pore water pressure profile with depth).
- Ground gas and groundwater monitoring wells to be installed on site and monitored on a minimum of six occasions to confirm the absence of a ground gas risk on site. This should be carried out in accordance with relevant NHBC Guidance, the CIRIA Report

C665: Assessing Risks Posed by Hazardous Ground Gases to Buildings: A Guide to Good Practice (Wilson et al 2007) and the British Standard 8576:2013.

Laboratory-Based Works

- Suite of geotechnical testing to include classification, strength and stiffness testing. The latter should include oedometer, swell and swell pressure, triaxial (UU and CU with pore water pressure measurement).
- Suite of geo-environmental testing (taking cognisance of the findings from the preliminary qualitative risk assessment). Waste classification testing would be undertaken based on a review of the precise project requirements.

Monitoring

- Standpipe piezometers should be installed within any cohesionless superficial deposits and soils at depth as part of the ground investigation phase, to record the location of a perched groundwater table and groundwater head at depth. Vibrating wire piezometers may also be considered within cohesive soils.
- Sampling of soils and groundwater (if encountered) for geo-environmental chemical/contamination analyses.
- Ground gas and groundwater monitoring wells to be installed on site and monitored on a minimum of six occasions to confirm the
 absence of a ground gas risk on site. As noted above, this should be carried out in accordance with relevant NHBC Guidance, the
 CIRIA Report C665: Assessing Risks Posed by Hazardous Ground Gases to Buildings: A Guide to Good Practice (Wilson et al 2007)
 and the British Standard (BS) 8576:2013.

Reporting

- Preparation of geotechnical and geo-environmental factual and interpretative reports, presenting findings from the fieldwork and laboratory testing and site/condition specific recommendations.
- The interpretative reporting would comprise the preparation of a Geotechnical Design Report (GDR) in accordance with BS EN 1997 and a Geo-environmental Quantitative Risk Assessment Report.
- Site constraints plan. This would comprise a live document, which captures/records all known features, obstructions and constraints which affect the proposed development. Whilst all disciplines would be expected to feed into the development of this document, the ground investigation will serve as an indispensable tool in further informing this process.

A detailed ground investigation specification will be prepared as the scheme progresses. This process will be further informed by ongoing design development and optioneering, such that the scope of the investigation can be refined and fine-tuned to meet the project requirements.

Should any unexpected contamination be identified during the future groundworks, then a suitably qualified and experienced Geo-Environmental Engineer should be consulted and if necessary, further assessment should be carried out.

The precise nature of the scope will also be influenced by geo-environmental requirements set out by the Local Authority and the London Borough of Camden.

9. Closing Remarks

A-squared Studio Engineers Ltd was appointed by Heyne Tillett Steel Ltd to prepare a geotechnical and geo-environmental desk study for the proposed redevelopment located at Grange Central St Martins, Holborn, London.

The proposed development comprises the reuse and refurbishment of the existing Lethaby Building (including its one-level basement), the redevelopment of the existing Red Lion Square and Central St Martins buildings into a seven- to fourteen-storey hotel structure, and the demolition of the existing Cochrane Theatre and construction of a ten-storey residential building in its place. The existing one-level basement covering the eastern section of the site will be deepened into a three-level basement.

The ground conditions at the site indicate the presence of Lynch Hill Graves superficial deposits underlain by London Clay, Lambeth Group and Thanet Sands. It is considered likely that Made Ground of variable thickness and consistency is present across the site due to historical demolition and re-development.

The groundwater regime comprises perched groundwater within the superficial deposits and a likely hydrostatic pore water pressure profile within the upper London Clay Formation (with underdrainage towards the lower portion of the formation). The London Clay acts as an aquiclude, separating any near surface groundwater from the main aquifer at depth within the underlying strata and Chalk Formation.

A *Likely* UXO hazard rating was identified for the project site from a preliminary UXO desk study included with the Envirocheck report. ARP records identified 3.no. high explosive bomb strikes on site, with a further five HE bomb strikes within 65m. A command post 900m south of the site was also identified as a primary bombing target for the *Luftwaffe*. It is recommended that a UXO specialist is engaged to review the proposed development site and advise on risk mitigation measures.

A preliminary geo-environmental source-pathway-receptor risk assessment has been carried out as part of the geo-environmental desk-based review. The Phase I qualitative assessment has considered available data and logged industrial entries available in the public domain. The site has been historically used as educational facility since the 1900s, and a wide range of potential contaminants have been identified as part of the risk assessment, and the geo-environmental considerations outlined in Section 6 suggest that the site is subject to **moderate** risk.

The desk-based review has presented a series of considerations and general design guidance relating to the construction of the substructure of the proposed development, considering the possible reuse of the existing foundation system and installation of new foundations. At the time of writing this report, there is no available information regarding the existing foundation systems on-site.

Propped secant/contiguous pile walls and sheet pile walls are assessed to be suitable retention system options for the new excavation (sheet pile options should be reviewed with caution for basement proposals due to installations limitations and constraints), subject to confirmation of the existing groundwater table. Underpinning may also be considered for the excavation adjacent to the existing Lethaby Hall basement. Further detailed assessment of ground movements is highly recommended to mitigate any damage to surrounding structures, such as the Crossrail 1 tunnels, Piccadilly Line tunnels, Royal Mail Post Office Tunnels, and Thames Water pipes and sewers immediately surrounding the site. No significant concerns regarding short-term groundwater cut-off were identified, as any retaining walls surrounding the basement excavation can be embedded into the underlying low permeability London Clay Formation.

From a foundation design perspective, a monolithic raft system or pile foundations are assessed to be suitable for the proposed development, providing adequate ULS and SLS performance. If the monolithic raft is founded on the London Clay Formation, SLS drivers will typically govern the design, particularly when considering differential settlement and the impact of global ground movements on the surrounding sensitive listed structures and assets. Generally, piles may be formed by means of contiguous flight auger or traditional rotary bored techniques. However, it is considered likely that piling works will be subject to significant access and headroom restrictions. As a result, piles may be required to be installed via rotary techniques, with specially adapted restricted access rigs, which may have the effect of restricting the piling supply chain at an early stage of the design development. Early engagement with specialist piling contractors is

considered prudent, in order to fully understand rig and access capabilities – ensuring a feasible substructure design is ultimately developed. Any existing rafts or piles that are to be subjected to reuse and increased loading will need to be assessed from an existing capacity and proposed loading perspective

Net loading (and areas of potential net hydrostatic uplift) will require particular attention and potential means of mitigation.

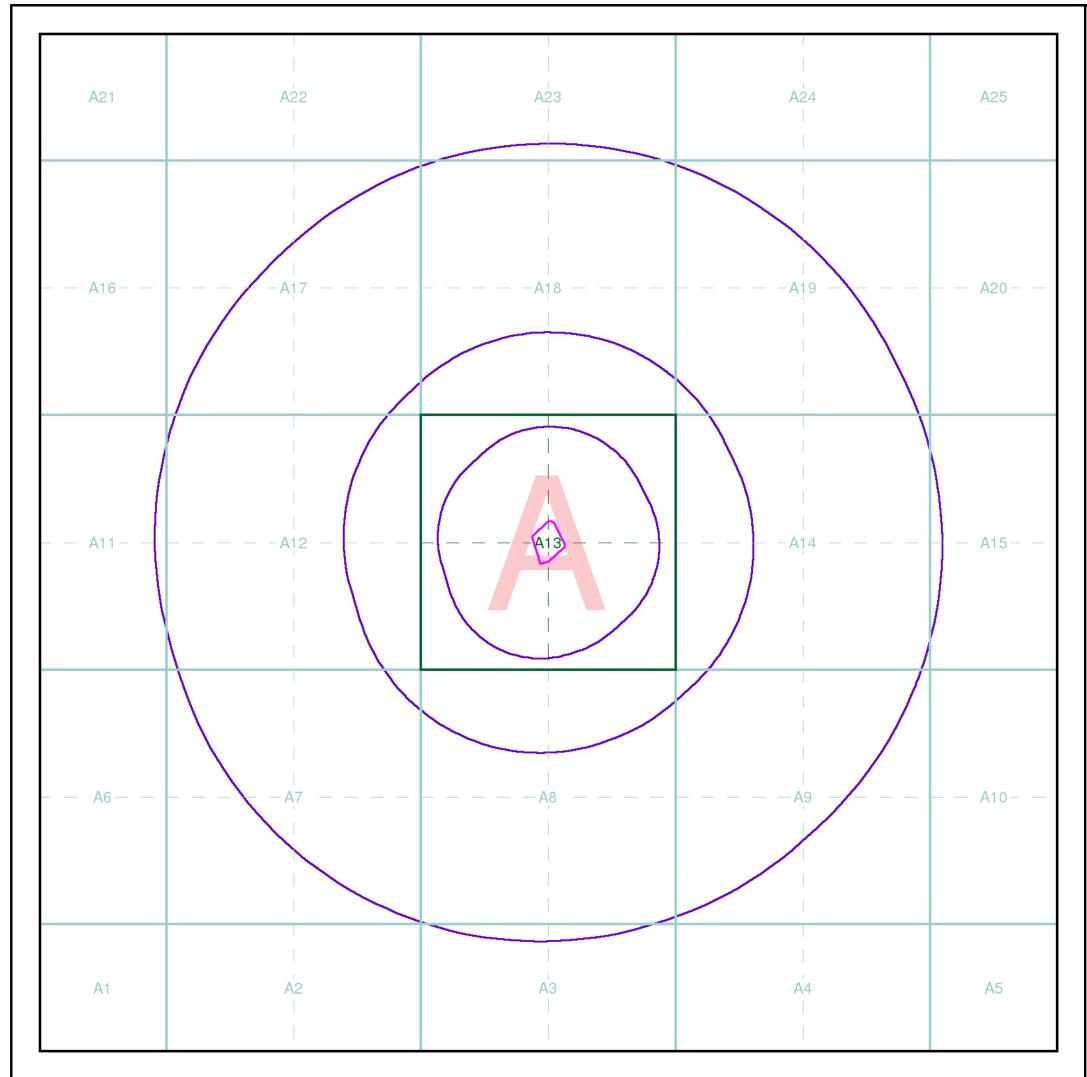

Various construction related considerations, risks and mitigation measures have been discussed. These will require further thought and development as part of the evolution of the substructure design and buildability review.

A Basement Impact Assessment will be produced for the scheme, in line with the London Borough of Camden planning requirements. The precise scope of this BIA will be informed by a screening process and the findings of the study presented herein. The BIA will incorporate a GMA (ground movement assessment) which demonstrates the impact of the works on adjacent sensitive structures / assets. A hydrogeological study may also be required; this will be dependent on ascertaining the extent of any existing basements in the vicinity of the development.

Ground investigation recommendations have been presented in Section 8. These comprise both geotechnical and geo-environmental requirements (including recommendations for fieldwork, laboratory testing and instrumentation/monitoring). Reporting requirements and recommendations for development of a constraints plan have been presented alongside the investigation intent.

Envirocheck®

LANDMARK INFORMATION GROUP*

Index Map

For ease of identification, your site and buffer have been split into Slices, Segments and Quadrants. These are illustrated on the Index Map opposite and explained further below.

Slice

Each slice represents a 1:10,000 plot area (2.7km x 2.7km) for your site and buffer. A large site and buffer may be made up of several slices (represented by a red outline), that are referenced by letters of the alphabet, starting from the bottom left corner of the slice "grid". This grid does not relate to National Grid lines but is designed to give best fit over the site and buffer.

Segmen

A segment represents a 1:2,500 plot area. Segments that have plot files associated with them are shown in dark green, others in light blue. These are numbered from the bottom left hand corner within each slice.

Quadrant

A quadrant is a quarter of a segment. These are labelled as NW, NE, SW, SE and are referenced in the datasheet to allow features to be quickly located on plots. Therefore a feature that has a quadrant reference of A7NW will be in Slice A, Segment 7 and the NW Quadrant.

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination.

For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client.

In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.
