DOCUMENT HISTORY

Revision	Status	Comments	Date
Rev 0 DRAFT		For Internal Review	
		(Client / Design Team)	

1. SUMMARY

- 1.1 The existing site is a residential property with substantive rear garden containing a number of trees potentially constraining development. The proposal includes the reconfigurations of the landscaping of the front garden.
- 1.2 There are 9 trees on the property and adjoining land outside of the application boundary that are within close proximity to the development and need to be assessed. These are judged mostly moderate and low-quality trees, but with high quality trees T7 and T8 as standout high quality specimens. All trees are material constraints on development, but these latter require particular consideration.
- 1.3 The report has assessed the impacts of the development proposals and concludes there would be at most a low impact on the resource: it is not necessary to fell or prune any tree to facilitate the proposal.
- 1.4 Whilst the default position is that structures be located outside the Root Protection Area* (RPA) of trees to be retained, there are some modest encroachments that could not be avoided in the design of the scheme. The report has demonstrated that the tree(s) can remain viable and notes that the proposals themselves will improve the soil environment that is used by the tree for growth. Net impacts are assessed therefore as being very low.
- 1.5 Notwithstanding the above assurances, the report sets out a series of recommendations prior and during construction that will ensure impacts to trees are minimised. These are detailed in sections 6.3 and 8 of this report.
- 1.6 In conclusion, the proposal, through following the above recommendations, will have no, or very limited, impact on the existing trees and is acceptable.

2. INTRODUCTION

2.1 Terms of Reference

- 2.1.1 This Arboricultural Impact Assessment report has been prepared by Landmark Trees (LT) on behalf of Carver Farshi (the Applicant's agent), to support a full planning application submitted to the London Borough of Camden ('LBC').
- 2.1.2 This application comprises a reconfiguration of the front garden, front gate and external access steps.
- 2.1.3 This report will assess the impact on trees and their constraints, identified in our survey. Although the proposals were known at the time of the survey, Landmark Trees endeavour to survey each site blind, working from a topographical survey, wherever possible, with the constraints plan informing their evolution. The purpose of the report is to provide guidance on how trees and other vegetation can be integrated into construction and development design schemes. The overall aim is to ensure the protection of amenity by trees which are appropriate for retention.
- 2.1.4 Trees are a material consideration for a Local Planning Authority when determining planning applications, whether or not they are afforded the statutory protection of a Tree Preservation Order or Conservation Area. British Standard BS 5837:2012 Trees in Relation to Design, Demolition and Construction sets out the principles and procedures to be applied to achieve a harmonious and sustainable relationship between trees and new developments. The Standard recommends a sequence of activities (see Fig.1 overleaf) that starts in the initial feasibility and design phase (RIBA Stage 2 'Concept Design') with a survey to qualify and quantify the trees on site and establish the arboricultural constraints to development (aboveand below-ground) to inform the design in an iterative process, and continues with an assessment of the arboricultural impacts of the final design and measures to mitigate such impacts should they be negative. Detailed technical specifications for mitigation and protection measures are devised in the design phase that follows (RIBA Stage 3-4 'Developed and Technical design'), and the sequence ends with the Implementation and Aftercare phase (RIBA Stages 5-7) with the implementation of those measures once planning permission is granted, guided by Arboricultural Method Statements (RIBA Stage 4-5, 'Technical Design and Construction) and professional guidance where appropriate.
- 2.1.5 This report is produced to support the Design Team to the Scheme Design Approvals stage in the process chart overleaf.

2.2 Drawings Supplied

2.2.1 The drawings supplied by the client and relied upon by Landmark Trees in the formulation of our survey plans are:
 Existing site survey: E_Ground
 Proposals: 1903_PL_100

2.3 Scope & Limitations of Survey

- 2.3.1 As Landmark Trees' (LT) arboricultural consultant, Adam Hollis surveyed the trees on site on the 7th of August 2019, recording relevant qualitative data in order to assess both their suitability for retention and their constraints upon the site, in accordance with British Standard 5837:2012 Trees in relation to design, demolition and construction – Recommendations [BS5837:2012].
- 2.3.2 Our survey of the trees, the soils and any other factors, is of a preliminary nature. The trees were SURVEYED on the basis of the Visual Tree Assessment method expounded by Mattheck and Breloer (The Body Language of Trees, DoE booklet Research for Amenity Trees No. 4, 1994). LT have not taken any samples for analysis and the trees were not climbed but inspected from ground level.
- 2.3.3 The results of the tree survey, including material constraints arising from existing trees that merit retention, should be used (along with any other relevant baseline data) to inform feasibility studies and design options. For this reason, the tree survey should be completed and made available to designers prior to and/or independently of any specific proposals for development. Tree surveys undertaken after a detailed design has been prepared can identify significant conflicts: in such cases, the nature of and need for the proposed development should be set against the quality and values of affected trees. The extent to which the design can be modified to accommodate those trees meriting retention should be carefully considered. Where proposed development is subject to planning control, a tree survey should be regarded as an important part of the evidence base underpinning the design and access statement
- 2.3.3 A tree survey is generally considered invalid in planning terms after 2 years, but changes in tree condition may occur at any time, particularly after acute (e.g. storm events) or prolonged (e.g. drought) environmental stresses or injuries (e.g. root severance). Routine surveys at different times of the year and within two three years of each other (subject to the incidence of the above stresses) are recommended for the health and safety management of trees remote from highways or busy access routes. Annual surveys are recommended for the latter.
 2.3.4 The survey does not cover the arrangements that may be required in connection with the laying or removal of underground services.

Arboricultural Impact Assessment Report: 8 Oakhill Avenue, London NW3 7RE

2.4 Survey Data & Report Layout

2.4.1 Detailed records of individual trees are given in the survey schedule in Appendix 1. General husbandry recommendations are provided at Appendix 2 and are necessary regardless of development proceeding. Planning considerations notwithstanding, we trust these necessary recommendations are passed on to relevant parties with due diligence and the trees to be managed appropriately.
2.4.2 A site plan identifying the surveyed trees, based on the Instructing Party's drawings / topographical survey is provided in Part 3 of this report. This plan also serves as the Tree Constraints Plan with the theoretical Recommended Protection Areas (RPA's), tree canopies and shade constraints, (from BS5837: 2012) overlain onto it. These constraints are then overlain in turn onto the Instructing Party's proposals to create a second Arboricultural Impact Assessment Plan in Part 3. General observations, discussion, conclusions and recommendations follow, below.

3.0 SITE CHARACTERISTICS

3.1 Property Description & Planning Context

Photograph 1: Aerial view of application site

3.1.1	This property is located on the northern side of Oakhill Avenue and comprises a detached
	two-storey dwelling with sizeable front and rear gardens.
3.1.2	The property is set a significant height above street level with a front garden sloping down to
	the street and from east to west. There are significant changes in level within the front garden
	in line with the existing landscaping and retaining walls.
3.1.3	We understand one oak tree within the rear garden is subject to a Tree Preservation \ensuremath{Order}
	and that site stands within the Redington / $\ensuremath{Frognal}$ Conservation Area, both of which will affect
	the subject trees: it is a criminal offence to prune, damage or fell such trees without permission
	from the local authority.
3.1.4	Relevant local planning policies comprise Policy 7.21 of the London Plan 2016 and Policies
	A3, D1, and D2 of the Camden Local Plan (adopted 3rd July 2017).

3.2 Soil Description

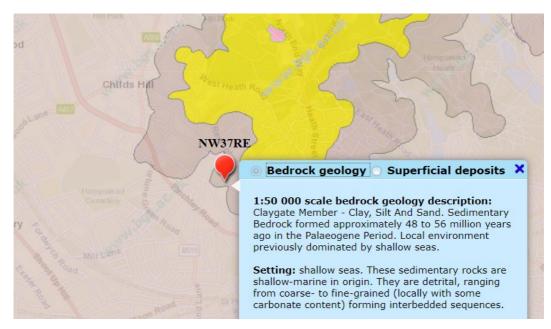

Figure 2: Extract from the BGS Geology of Britain Viewer

3.2.1 In terms of the British Geological Survey, the site overlies the Claygate Member / Beds (see dark area on plan extract overleaf). As the youngest part of the London Clay, they form a transition between the clay and the sandier Bagshot Beds above (shown in yellow). Unlike the Bagshot Beds, more typical of Hampstead Heath, the associated soils are generally, highly shrinkable clay; e.g. slowly permeable seasonally waterlogged fine loam over clay. Such highly plastic soils are prone to movement: subsidence and heave.
3.2.2 The actual limits of soil series are not as clearly defined on the ground as on plan and there may be anomalies between them. Further advice from the relevant experts on the specific soil properties can be sought as necessary.
3.2.3 Clay soils are prone to compaction during development. Damage to soil structure can have a serious impact on tree health. Design of foundations near problematic tree species will also need to take into consideration subsidence risk.

3.3 Subject Trees

3.3.1	Of the 9 surveyed trees, 2 are category* A (High Quality), 4 are category B (Moderate Quality),
	2 are category C (Low Quality) and 1 is category C/U (Low / Poor Quality); none are category
	U (Poor Quality).
3.3.2	The tree species found on the site comprise English oak, red oak, saucer magnolia, purple
	plum, beech and birch.
3.3.3	In terms of age demographics there are predominantly semi-mature and mature trees present
	with one young specimen also present.

*page 9 of: British Standards Institute: Trees in relation to design, demolition and construction BS 5837: 2012 HMSO, London

3.3.4	Full details of the surveyed trees can be found in Appendix 1 of this report.
3.3.5	There are recommended works for 1 on-site tree (T9). These are listed in Appendix 2.

Photograph 2: Existing landscaping of No. 8 Oakhill Avenue's front garde

Arboricultural Impact Assessment Report: 8 Oakhill Avenue, London NW3 7RE Instructing party: Carver Farshi Prepared by: David Gardner & Adam Hollis of Landmark Trees, Holden House, 4th Floor, 57 Rathbone Place, London W1T 4JU

4.0 DEVELOPMENT CONSTRAINTS

4.1 Primary Constraints

- 4.1.1 BS5837: 2012 gives Recommended Protection Areas (RPA's) for any given tree size. The individual RPA's are calculated in the Tree Schedule in Appendix 1 to this report, or rather the notional radius of that RPA, based on a circular protection zone. The prescribed radius is 12-x stem diameter at 1.5m above ground level, except where composite formulae are used in the case of multi-stemmed trees.
 4.1.0 Disclore RPA's are calculated for individual Protection Areas (RPA's) for any given tree size. The individual RPA's are calculated in the Tree Schedule in Appendix 1 to this report, or rather the notional radius of that RPA, based on a circular protection zone. The prescribed radius is 12-x stem diameter at 1.5m above ground level, except where composite formulae are used in the case of multi-stemmed trees.
- 4.1.2 Circular RPA's are appropriate for individual specimen trees grown freely, but where there is ground disturbance, the morphology of the RPA can be modified to an alternative polygon, as shown in the diagram below (Figure 2). Alternatively, one need principally remember that RPA's are area-based and not linear notional rather than fixed entities.

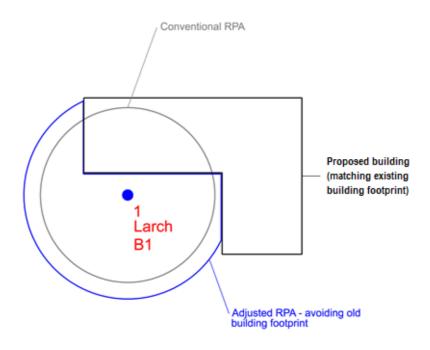

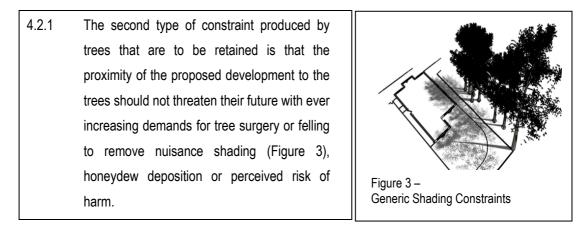

Figure 2 – Generic BS 5837 RPA Adjustments

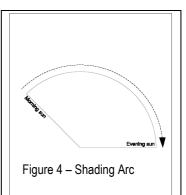

4.1.3 In BS5837, paragraph 4.6.2 states that RPA's should reflect the morphology and disposition of the roots; where pre-existing site conditions or other factors indicate that rooting has occurred asymmetrically, a polygon of equivalent area should be produced. Modifications to the shape of the RPA should reflect a soundly based arboricultural assessment of likely root distribution. This can be done as a desktop / theoretical exercise but is not altogether (scientifically) reliable and may also invite disagreement / differences of opinion as to that distribution.

- 4.1.4 No a priori RPA modifications have been made in this instance on account of the difficulty in presenting an accurate, reasonable priority area to protect for T2 in particular although it is our working hypothesis that the retaining walls will have prevented root growth beyond them.
- 4.1.5 The quality of trees will also be a consideration: U Category trees are discounted from the planning process in view of their limited useful life expectancy. Again, Category-C trees would not normally constrain development individually, unless they provide some external screening function.
- 4.1.6 At paragraph 5.1.1. BS5837: 2012 notes that "Care should be exercised over misplaced tree preservation; attempts to retain too many or unsuitable trees on a site are liable to result in excessive pressure on the trees during demolition or construction work, or post-completion demands on their removal."
- 4.1.8 In theory, only moderate quality trees and above are significant material constraints on development. However, low quality trees comprise a constraint in aggregate, in terms of any collective loss / removal, where replacement planting is generally considered appropriate.
 4.1.9 In this instance, the high quality trees have the potential to pose significant constraints upon development.

4.2 Secondary Constraints

4.2.2 The shading constraints are crudely determined from BS5837 by drawing an arc from northwest to east of the stem base at a distance equal to the height of the tree, as shown in the diagram opposite. Shade is less of a constraint on nonresidential developments, particularly where rooms are only ever temporarily occupied.

4.2.3 This arc (see Figure 4) represents the effects that a tree will have on layout through shade, based on shadow patterns of 1x tree height for a period May to Sept inclusive 10.00-18.00 hrs daily.

4.2.4 Assuming that they will be retained, the orientation of the on-site trees means they have the potential to provide a variety of secondary constraints, including shading, organic deposition and the potential need to maintain crown clearance in the future. The significance of these constraints will vary depending on the location and proximity to the proposed re-development which is considered below (in Sections 5 & 6). As specified by BS5837, this section (4) of the report considers only the site as it is, not in the light of pending proposals.

Note: Sections 5 & 6 below will now assess the impacts of the proposals upon constraints identified in Section 4 above. Table 1 in Section 5 presents the impacts in tabular form (drawing upon survey data presented in Appendices 1 & 2). Impacts are presented in terms of whole tree removal and the effect on the landscape or partial encroachment (% of RPA) and its effect on individual tree health. Section 6 discusses the table data, elaborating upon the impacts' significance and mitigation.

Table 1: Arboricultural Impact Assessment

(Impacts assessed prior to mitigation and rated with reference to Matheny & Clark (1998))

B.S. Cat.	Tree No.	Species	Impact	Tree / RPA Affected	Age	Growth Vitality	Species Tolerance	Impact on Tree Rating	Impact on Site Rating	Mitigation
В	2	Oak, English	Landscape Reconfiguration within RPA Note: Will result in a net 10sqm increase in rooting volume	m² N/A %	Mature	Moderate	Moderate	Very Low	Very Low	Airspade / manual excavation

6.0 ARBORICULTURAL IMPLICATIONS

6.1 Rating of Primary Impacts

No tree removals or pruning are required and therefore, the principal impacts in the current
proposals are the reconfiguration of a number of the landscaped 'islands' within the theoretical
RPA of T2. This reconfiguration comprises the enlargement of the island the tree stands in,
excavations within the central island to accommodate the new steps and realigning the island
T4 stands in.
The enlargement of the island T2 stands in will provide betterment by increasing the potential
rooting volume available whilst the reconfiguration of the other 2 islands will take place beyond
both the retaining wall of T2's island and the retaining walls of the central and western island.
As such, it is highly unlikely any roots will be disturbed by these works and impacts are
assessed as being likely to be very low at most.
In our view, the tree(s) are of a species, age and condition sufficient to remain viable in the
circumstances, given that the area lost to encroachment is highly unlikely to be a priority area
to protect, and provided the series of mitigation measures outlined below are followed to both
reduce the immediate impact of working methods. Supervision and monitoring of such
measures will also be essential. Subject to these provisos the net impacts are assessed as
being low.
There is no set RPA encroachment that is immediately permissible. However, at para 5.3.a
of BS5837, the project arboriculturist is charged with demonstrating that the tree(s) will remain

of BS5837, the project arboriculturist is charged with demonstrating that the tree(s) will remain viable in the instance of RPA encroachment. Whilst there is little research on RPA encroachment itself, there have been various commonly cited studies of root severance (see overleaf). Whilst the RPA is not coextensive with the wider root system, one can make some correlations after Thomas (2014): in average (sic) conditions, a straight line tangential with a tree's canopy would transect 15% of the root system, for another mid-way to the trunk that figure would be 30%. In the current cases, the impacts would be well below the lower of these two parameters as can be seen in Plan 2 in the Appendix or where more irregular in profile, can be gleaned from the percentage RPA encroachments in Table 1. There is no precise correlation between % RPA and root impairment or loss. However, in our experience, most RPA tend to exceed the free-grown canopy spread a little (c. x 1.2 -1.5), suggesting by reference to both Thomas and Fig. 5a - 5c overleaf, RPA encroachments marginally understate the percentage root loss. The informal 20% RPA threshold may equate to c. 30% root loss, and 10% RPA encroachment to c. 20% root loss. The assumptions made here are relatively crude and apply more to open grown trees but are nonetheless illustrative.

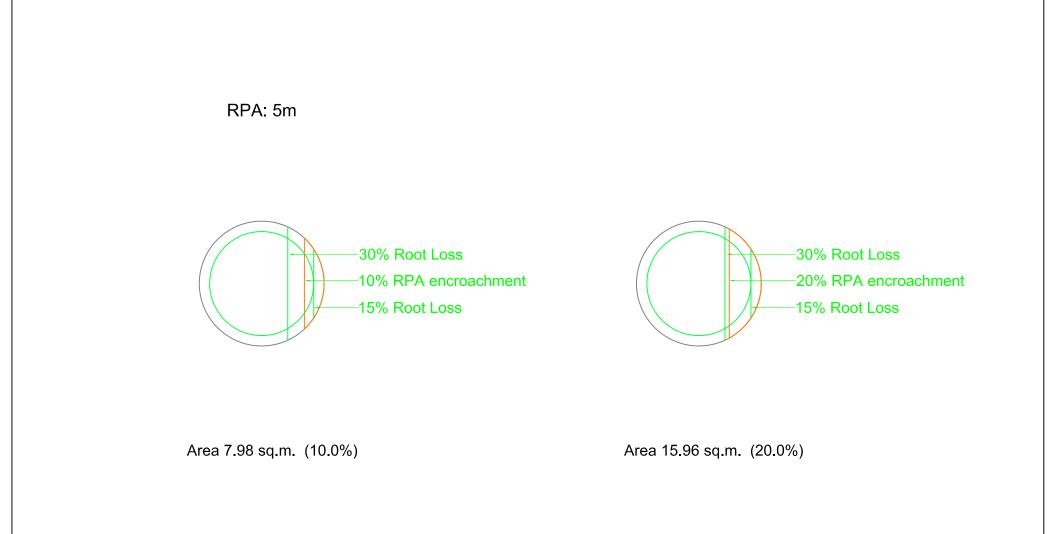

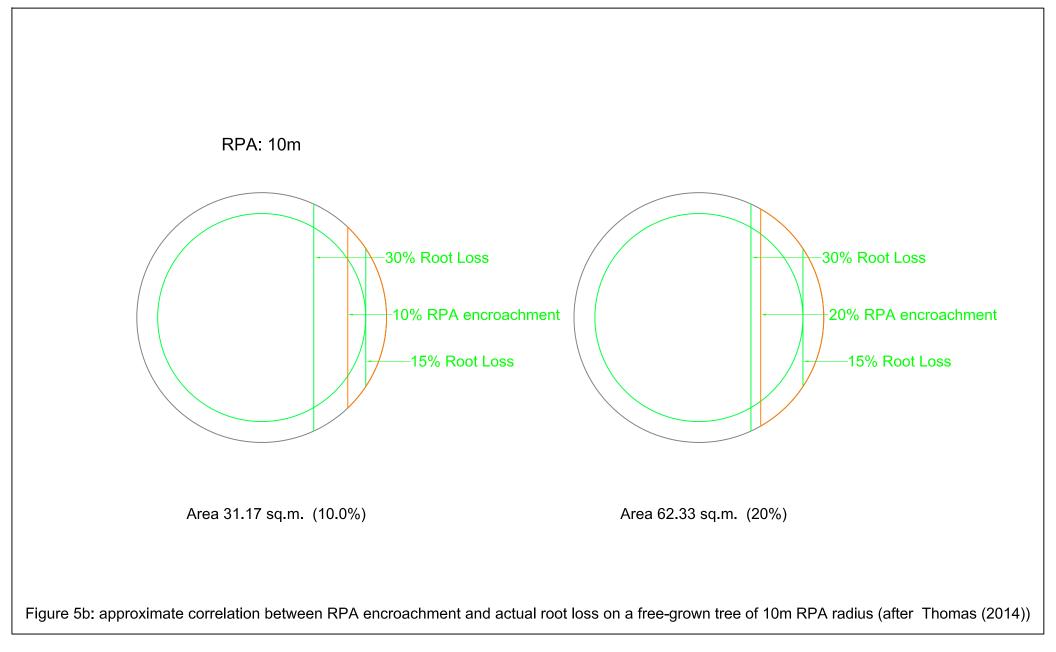

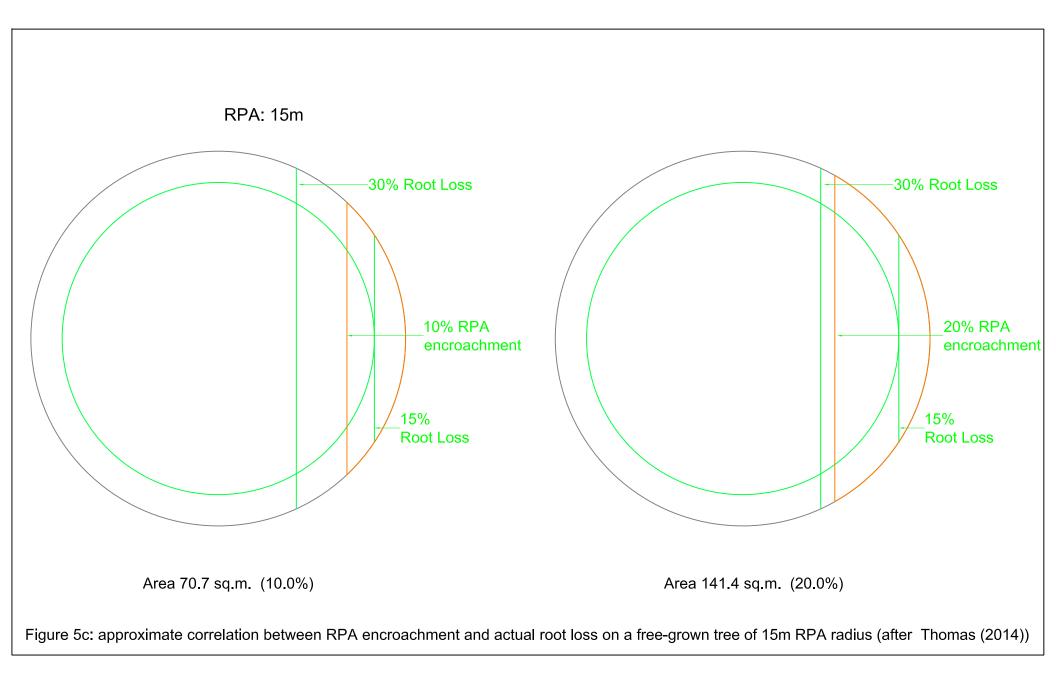

Figure 5a: approximate correlation between RPA encroachment and actual root loss on a free-grown tree of 5m RPA radius (after Thomas (2014))

- 6.1.5 Published references suggest healthy trees tolerating up to 30-50% root severance in general (Coder, Helliwell and Watson in CEH 2006). "In practice 50% of roots can sometimes be removed with little problem, provided there are vigorous roots elsewhere. Inevitably, this degree of root loss will temporarily slow canopy growth and even lead to some dieback" (Thomas 2014). Clearly, it is not the purpose of this report to sanction impacts to test a tree's physiological tolerance, where the guidance recommends the avoidance of impact / RPA encroachment as the default position. However, it has not proved possible at the design stage to avoid such encroachment altogether, and in that regard, the project arboriculturalist has determined that the retained trees can remain viable in the scheme before planning.
 6.1.6 The trees in guestion are about in Table 1 about to be healthy appriment of apprison with a
- 6.1.6 The trees in question are shown in Table 1 above to be healthy specimens of species with a good resistance to development impacts, and of an age quite capable of tolerating these limited impacts. Nor do the site characteristics suggest specific soil anomalies (e.g. heavy clay) having a bearing on such considerations, provided appropriate measures (e.g. ground protection) are taken.
- 6.1.7 As per BS5837 recommendations (at 5.3.a), the above assessment demonstrates that the tree(s) can remain viable. It will be noted that the proposals themselves will improve the rooting conditions of the affected tree.

6.2 Rating of Secondary Impacts

6.2.1 The nature of the proposals means that assessment of secondary impacts is moot.

6.3 Mitigation of Impacts

6.3.1 The removal of the existing retaining walls within RPAs should be undertaken by hand.

6.3.2 The limits of excavation within the RPA of T2 will be undertaken manually; any roots encountered will be cleanly pruned back to an appropriate junction with a sharp pruning saw or secateurs. Roots larger than 25mm diameter may only be cut in consultation with an arboriculturalist.

7.0 CONCLUSION

- 7.1 The potential impacts of development are all low with no tree removal required and only very minor RPA encroachments of trees retained. In the latter case, the report has demonstrated as per BS5837 paragraph 5.3.1 (a) that the tree can remain viable and notes that the proposals will improve the rooting conditions of the affected tree.
- 7.2 The full potential of the impacts can thus be largely mitigated through design and precautionary measures. These measures can be elaborated in Method Statements in the discharge of planning conditions.
- 7.3 The species affected are generally tolerant of root disturbance / crown reduction and the retained trees are generally in good health and capable of sustaining these reduced impacts.
- 7.4 Therefore, the proposals will not have any significant impact on either the retained trees or wider landscape thereby complying with Policy 7.21 of the London Plan 2016 and Policies A3, D1, and D2 of the Camden Local Plan (adopted 3rd July 2017). Thus, with suitable mitigation and supervision the scheme is recommended to planning.

8.0 RECOMMENDATIONS

8.1 Specific Recommendations

8	.1.1	Tree works recommendations in Appendix 2 are not part of the current application, but
		requirements of general maintenance that will need to be applied for (subject to para. 3.3 of
		this report and any other relevant constraints in planning or leasehold) by the client separately.
		Consent for the current planning application does not impart any consent for the Appendix 2
		maintenance works. Please note, though, the owner and / or manager of a property have a
		duty to maintain a safe site of work and to protect occupiers of the surrounding land / members
		of the public from tree hazards. Works recommended in this report should be enacted in a
		timely fashion by the relevant party regardless of the progress of the development.
8	.1.2	Excavation and construction impacts within the RPA's of trees identified in Table 1 above, will

Excavation and construction impacts within the RPA's of trees identified in Table T above, will need to be controlled by method statements specifying mitigation methods suggested in para 6.3 above and by consultant supervision as necessary.

8.2 Outline Method Statement for Sites Being Developed with Trees

- 8.2.1 Any trees which are in close proximity to the proposed development should be protected with a Tree Protection Barrier (TPB). Protective barrier fencing should be installed immediately following the completion of the tree works, remaining in situ for the entire duration of the development unless otherwise agreed in writing by the Council. It should be appropriate for the intensity and proximity of the development, usually comprising steel, mesh panels 2.4m in height ('Heras') and should be mounted on a scaffolding frame (shown in Fig 2 of BS5837:2012). The position of the TPB can be shown on plan as part of the discharge of conditions, once the layout is agreed with the planning authority. The TPB should be erected prior to commencement of works, remain in its original form on-site for the duration of works and be removed only upon full completion of works.
- 8.2.2 A TPB may no longer be required during soft landscaping work but a full arboricultural assessment must be performed prior to the undertaking of any excavations within the RPA of a tree. This will inform a decision about the requirement of protection measures. It is important that all TPBs have permanent, weatherproof notices denying access to the RPA.
- 8.2.3 The use of heavy plant machinery for building demolition, removal of imported materials and grading of surfaces should take place in one operation. The necessary machinery should be located above the existing grade level and work away from any retained trees. This will ensure that any spoil is removed from the RPAs. It is vital that the original soil level is not lowered as this is likely to cause damage to the shallow root systems.
- 8.2.4 Any pruning works must be in accordance with British Standard 3998:2010 Tree work [BS3998].
- 8.2.5 Where sections of hard surfacing are proposed in close proximity to trees, it is recommended that "No-Dig" surfacing be employed in accordance with BS5837:2012 and 'The Principles of Arboricultural Practice: Note 1, Driveways Close to Trees, AAIS 1996 [APN1]'.
- 8.2.6 If the RPA of a tree is encroached by underground service routes then BS5837:2012 and NJUG VOLUME 4 provisions should be employed. If it is deemed necessary, further arboricultural advice must be sought.
- 8.2.7 Numerous site activities are potentially damaging to trees e.g. parking, material storage, the use of plant machinery and all other sources of soil compaction. In operating plant, particular care is required to ensure that the operational arcs of excavation and lifting machinery, including their loads, do not physically damage trees when in use.

8.2.8	To ena	ble the successful integration of the proposal with the retained trees, the following
	points	will need to be taken into account:
	1)	Plan of underground services.
	2)	Schedule of tree protection measures, including the management of harmful
		substances.
	3)	Method statements for constructional variations regarding tree proximity (e.g.
		foundations, surfacing and scaffolding).
	4)	Site logistics plan to include storage, plant parking/stationing and materials
		handling.
	5)	Site supervision: the Site Agent must be nominated to be responsible for all day-
		to-day arboricultural matters on site. This person must:
		 be present on site for the majority of the time;
		 be aware of the arboricultural responsibilities;
		have the authority to stop work causing, or may cause harm to any tree;
		 ensure all site operatives are aware of their responsibilities to the trees on
		site and the consequences of a failure to observe these responsibilities;
		arrange with the retained arboricultural consultant an initial pre-start
		briefing to inspect tree protection measures and agree a schedule of monitoring
		thereof on an initial monthly basis to be reviewed over the duration of works.
		■ give advance notice (ideally 2 weeks) to retained arboricultural consultant
		to arrange for supervision of any excavation (especially for services and
		foundations) within RPA
		■ make immediate contact with the local authority and/or a retained
		arboricultural consultant in the event of any tree related problems occurring.
8.2.9	These	points can be resolved and approved through consultation with the planning authority
	via the	ir Arboricultural Officer although we understand that services will run in line with the
	steps c	or previously approved routes and that points 2, 3 and 4 will be in line with previously
	approv	ed works to the rear of the site.
8.2.10	The se	quence of works should be as follows:
	i)	installation of TPB for demolition & construction;
	ii)	installation of underground services;
	iii)	installation of ground protection;
	iv)	main construction;
	v)	removal of TPB;
	vi)	soft landscaping.

9.0 COMPLIANCE: Trees and the Planning System

- 9.1 Under the UK planning system, local authorities have a statutory duty to consider the protection and planting of trees when granting planning permission for proposed development. The potential effect of development on trees, whether statutorily protected (e.g. by a tree preservation order or by their inclusion within a conservation area) or not, is a material consideration that is taken into account in dealing with planning applications. Where trees are statutorily protected, it is important to contact the local planning authority and follow the appropriate procedures before undertaking any works that might affect the protected trees.
- 9.2 The nature and level of detail of information required to enable a local planning authority to properly consider the implications and effects of development proposals varies between stages and in relation to what is proposed. Table B.1 provides advice to both developers and local authorities on an appropriate amount of information. The term "minimum detail" is intended to reflect information that local authorities are expected to seek, whilst the term "additional information" identifies further details that might reasonably be sought, especially where any construction is proposed within the RPA.
- 9.3 This report delivers information appropriate to a full planning application and to these specific proposals as per BS5837 Table B.1 below, providing both minimum details and further additional material in the form of general tree protection recommendations and constructional variation.

Stage of process	Minimum detail	Additional information
Pre-application	Tree survey	Tree retention/removal plan (draft)
Planning application	Tree survey (in the absence of pre-application discussions)	Existing and proposed finished levels
	Tree retention/removal plan (finalized)	Tree protection plan
	Retained trees and RPAs shown on proposed layout	Arboricultural method statement – heads of terms
	Strategic hard and soft landscape design, including species and location of new tree planting	Details for all special engineering within the RPA and other relevant construction details
	Arboricultural impact assessment	
Reserved matters/ planning conditions	Alignment of utility apparatus (including drainage), where outside the RPA or	Arboricultural site monitoring schedule
	where installed using a trenchless method	Tree and landscape management plan
	Dimensioned tree protection plan	Post-construction remedial works
	Arboricultural method statement – detailed	Landscape maintenance schedule
	Schedule of works to retained trees, e.g. access facilitation pruning	
	Detailed hard and soft landscape design	

Table B.1 Delivery of tree-related information into the planning system

Caveats

This report is primarily an arboricultural report. Whilst comments relating to matters involving built structures or soil data may appear, any opinion thus expressed should be viewed as qualified, and confirmation from an appropriately qualified professional sought. Such points are usually clearly identified within the body of the report. It is not a full safety survey or subsidence risk assessment survey. These services can be provided but a further fee would be payable. Where matters of tree condition with a safety implication are noted during a survey they will of course appear in the report.

A tree survey is generally considered invalid in planning terms after 2 years, but changes in tree condition may occur at any time, particularly after acute (e.g. storm events) or prolonged (e.g. drought) environmental stresses or injuries (e.g. root severance). Routine surveys at different times of the year and within two - three years of each other (subject to the incidence of the above stresses) are recommended for the health and safety management of trees remote from highways or busy access routes. Annual surveys are recommended for the latter.

Tree works recommendations are found in the Appendices to this report. It is assumed, unless otherwise stated ("ASAP" or "Option to") that all husbandry recommendations will be carried out within 6 months of the report's first issue. Clearly, works required to facilitate development will not be required if the application is shelved or refused. However, necessary husbandry work should not be shelved with the application and should be brought to the attention of the person responsible, by the applicant, if different. Under the Occupiers Liability Act of 1957, the owner (or his agent) of a tree is charged with the due care of protecting persons and property from foreseeable damage and injury.' He is responsible for damage and/or nuisance arising from all parts of the tree, including roots and branches, regardless of the property on which they occur. He also has a duty under The Health and Safety at Work Act 1974 to provide a safe place of work, during construction. Tree works should only be carried out with local authority consent, where applicable.

Inherent in a tree survey is assessment of the risk associated with trees close to people and their property. Most human activities involve a degree of risk, such risks being commonly accepted if the associated benefits are perceived to be commensurate.

Risks associated with trees tend to increase with the age of the trees concerned, but so do many of the benefits. It will be appreciated, and deemed to be accepted by the client, that the formulation of recommendations for all management of trees will be guided by the cost-benefit analysis (in terms of amenity), of tree work that would remove all risk of tree related damage.

Prior to the commencement of any tree works, an ecological assessment of specific trees may be required to ascertain whether protected species (e.g. bats, badgers and invertebrates etc.) may be affected.

PART 2 – APPENDICES

APPENDIX 1

TREE SCHEDULE

Botanical Tree Names

Beech, Common Birch, Silver Magnolia, Saucer : Fagus sylvatica : Betula pendula : Magnolia × soulangeana

Oak, English Oak, Red Plum, Purple : Quercus robur : Quercus rubra : Prunus cerasifera 'Nigra'

Notes for Guidance:

- 1. Height describes the approximate height of the tree measured in metres from ground level.
- 2. The Crown Spread refers to the crown radius in meters from the stem centre and is expressed as an average of NSEW aspect if symmetrical.
- 3. Ground Clearance is the height in metres of crown clearance above adjacent ground level.
- 4. Stem Diameter (Dm) is the diameter of the stem measured in millimetres at 1.5m from ground level for single stemmed trees. BS 5837:2012 formula (Section 4.6) used to calculate diameter of multi-stemmed trees. Stem Diameter may be estimated where access is restricted and denoted by '#'.
- 5. Protection Multiplier is 12 and is the number used to calculate the tree's protection radius and area
- 6. Protection Radius is a radial distance measured from the trunk centre.
- 7. Growth Vitality Normal growth, Moderate (below normal), Poor (sparse/weak), Dead (dead or dying tree).
- 8. Structural Condition Good (no or only minor defects), Fair (remediable defects), Poor Major defects present.
- Landscape Contribution High (prominent landscape feature), Medium (visible in landscape), Low (secluded/among other trees).
- B.S. Cat refers to (British Standard 5837:2012 section 4.5) and refers to tree/group quality and value;
 'A' High, 'B' Moderate, 'C' Low, 'U' Unsuitable for retention. The following colouring has been used on the site plans:
 - High Quality (A) (Green),
 - Moderate Quality (B) (Blue),
 - Low Quality (C) (Grey),
 - Unsuitable for Retention (U) (Red)
- 11. Sub Cat refers to the retention criteria values where 1 is Arboricultural, 2 is Landscape and 3 is Cultural including Conservational, Historic and Commemorative.
- 12. Useful Life is the tree's estimated remaining contribution in years.

APPENDIX 2

RECOMMENDED TREE WORKS

Notes for Guidance:

	Husban	dry 1 - Urgent (ASAP), 2 - Standard (within 6 months), 3 - Non-urgent (2-3 years)						
CB - Cut Back to boundary/clear from structure.								
	CL#	- Crown Lift to given height in meters.						
	CT#%	- Crown Thinning by identified %.						
	CR#%	 Crown Reduce by given maximum % (of outermost branch & twig length) 						
	DWD	- Remove deadwood.						
	Fell	- Fell to ground level.						
	Flnv	 Further Investigation (generally with decay detection equipment). 						
	Pol	- Pollard or re-pollard.						
	Mon	- Check / monitor progress of defect(s) at next consultant inspection which should be <18						
		months in frequented areas and <3 years in areas of more occasional use. Where clients						
		retain their own ground staff, we recommend an annual in- house inspection and where						
		practical, in the aftermath of extreme weather events.

PART 3 – PLANS

PLAN 1

TREE CONSTRAINTS PLAN

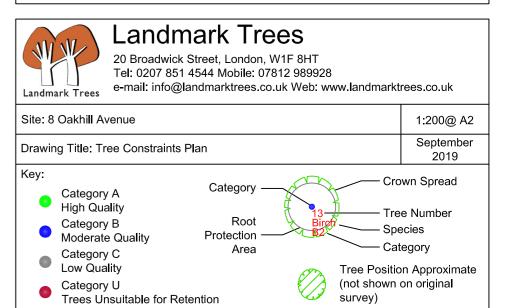

NOTE:

This survey is of a preliminary nature. The trees were inspected from the ground only on the basis of the Visual Tree Assessment method. No samples were taken for analysis. No decay detection equipment was employed. The survey does not cover the arrangements that may be required in connection with the laying or removal of underground services.

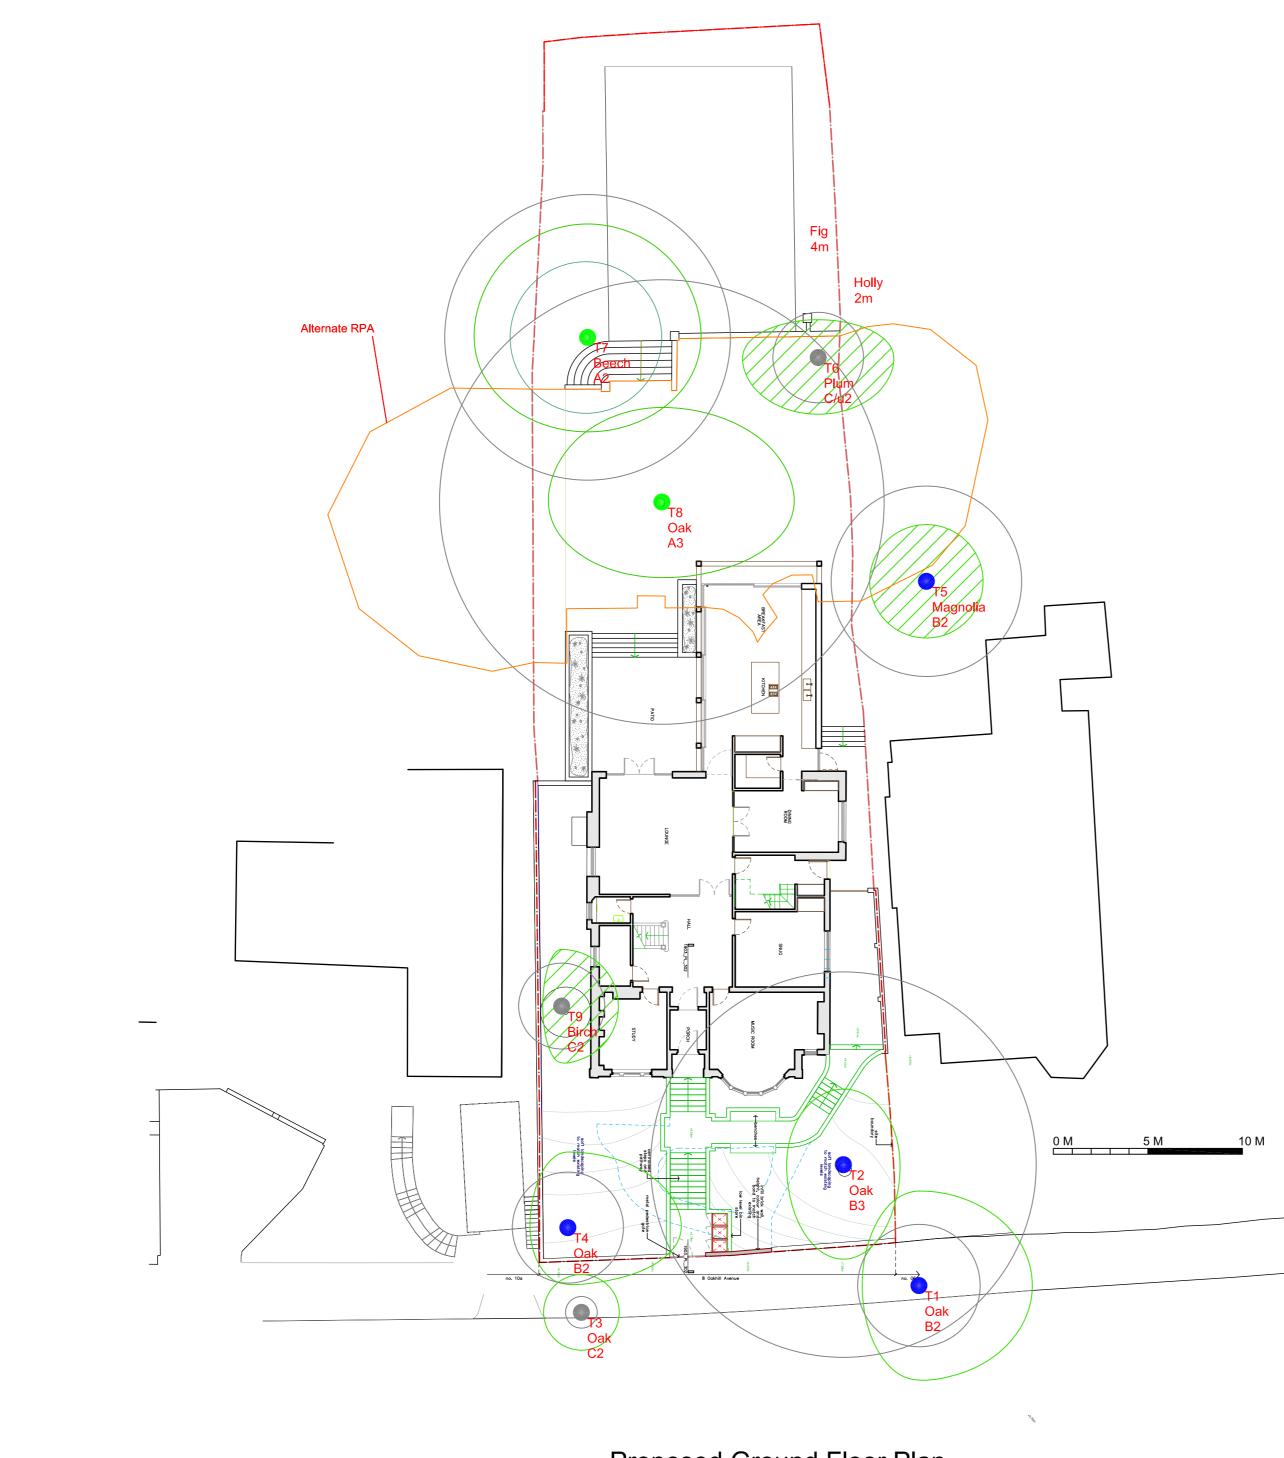

Branch spread in metres is taken at the four cardinal points to derive an accurate representation of the crown.

Root Protection Areas (RPA) are derived from stem diameter measured at 1.5 m above adjacent ground level (taken on sloping ground on the upslope side of the tree base).

ARBORICULTURAL IMPACT ASSESSMENT PLAN (S)

i. Ground Floor

NOTE:

This survey is of a preliminary nature. The trees were inspected from the ground only on the basis of the Visual Tree Assessment method. No samples were taken for analysis. No decay detection equipment was employed. The survey does not cover the arrangements that may be required in connection with the laying or removal of underground services.

Branch spread in metres is taken at the four cardinal points to derive an accurate representation of the crown.

Root Protection Areas (RPA) are derived from stem diameter measured at 1.5 m above adjacent ground level (taken on sloping ground on the upslope side of the tree base).
