

Notting Hill Genesis

Shoot Up Hill, London

Geo-environmental and Geotechnical Site Investigation

52193-R01 (02)

JUNE 2021

RSK GENERAL NOTES

Project No.: 52193-R01 (02)

Title: Geo-environmental and Geotechnical Site Investigation: 2 Shoot Up Hill, London

Client: Notting Hill Genesis, Bruce Kenrick House, 2 Killick Street, London, N1 9FL

Date: 03rd June 2021

Office: RSK Environment Limited, Anerley Court, Half Moon Lane, Hildenborough, TN11 9HU, Tel: +44 (0)1732 833111,

Status: Final

Revision control sheet

Revision reference	Date	Reason for revision
Rev 00	3rd September 2020	First issue
Rev 01	20 th May 2021	Updated proposal
Rev 02	03 rd June 2021	Updated - client comments_27 May 2021

RSK Environment Limited (RSK) has prepared this report for the sole use of the client, showing reasonable skill and care, for the intended purposes as stated in the agreement under which this work was completed. The report may not be relied upon by any other party without the express agreement of the client and RSK. No other warranty, expressed or implied, is made as to the professional advice included in this report.

Where any data supplied by the client or from other sources have been used, it has been assumed that the information is correct. No responsibility can be accepted by RSK for inaccuracies in the data supplied by any other party. The conclusions and recommendations in this report are based on the assumption that all relevant information has been supplied by those bodies from whom it was requested.

No part of this report may be copied or duplicated without the express permission of RSK and the party for whom it was prepared.

Where field investigations have been carried out, these have been restricted to a level of detail required to achieve the stated objectives of the work.

This work has been undertaken in accordance with the quality management system of RSK Environment Ltd.

1 INTRODUCTION

1.1 Commissioning

RSK Environment Limited (RSK) was commissioned by Notting Hill Genesis (the 'Client') to carry out a Geoenvironmental and Geotechnical Site Investigation of the site at land to the rear 2-4 Shoot Up Hill, London, hereafter referred to as 'the site'.

The project was commissioned in relation with the proposed development with a new residential building on site.

This report is subject to the RSK service constraints given in **Appendix A** and limitations that may be described through this document.

1.2 Objectives

The objective of this assessment is to obtain sufficient geotechnical information to inform the geotechnical design, to identify and evaluate any potential contamination issues from the proposed development, and to assess the potential waste classification implications of soil arisings.

1.3 Scope of works

The scope of this assessment has been developed in accordance with relevant British Standards and authoritative technical guidance as referenced through the report. The assessment of the contamination status of the site is in line with the technical approach presented in CLR 11 Model Procedures for the Management of Land Contamination (Environment Agency, 2004) and in general accordance with BS 10175: 2011 + A2 2017 (BSI, 2017). It is also compliant with relevant planning policy and guidance.

The scope of the intrusive investigation has been designed in line with the recommendations of BS5930: 2015 Code of practice for ground investigations (BSI, 2016), which maintains compliance with BS EN 1997-1 and 1997-2 and their related standards. Ground gas assessment has been undertaken in general accordance with BS8756: 2013 and BS 8485:2015+A1:2019.

A brief summary of relevant legislation and policy relating to contaminated land is given in **Appendix B**.

The project was carried out to an agreed brief as set out in RSK's proposal (Ref. 52193-T01(01), dated 26/05/2020). The scope of works for the assessment has included the following:

- a preliminary risk assessment (PRA) including development of an initial conceptual site model to consider any potentially complete pollutant linkages;
- an intrusive investigation, in situ testing, soil sampling, laboratory geo-environmental and geotechnical testing, groundwater and ground gas monitoring of installed borehole;

- off-site analysis for geotechnical and waste classification purposes;
- generic quantitative risk assessment (GQRA) to evaluate potentially complete contaminant linkages identified in the refined CSM;
- interpretation of ground conditions and geotechnical data to provide preliminary recommendations with respect to foundations and infrastructure design;
- preliminary assessment of the potential waste classification implications of soil arisings; and
- preparation of factual and interpretative report.

1.4 Limitations

The comments given in this report and the opinions expressed are based on the ground conditions encountered during the site work and on the results of tests made in the field and in the laboratory. However, there may be conditions pertaining to the site that have not been disclosed by the investigation and therefore could not be taken into account. It should be noted that there may be areas of made ground not detected due to the limited nature of the investigation or the thickness and quality of made ground across the site may be variable.

In addition, groundwater levels and ground gas concentrations and flows may vary from those reported due to seasonal, or other, effects and the limitations stated in the data should be recognised.

Preliminary geotechnical recommendations are presented, and these should be verified in a Geotechnical Design Report once proposed construction and structural design proposals are confirmed.

2 SITE DETAILS

2.1 Site location

Site location details are presented in **Table 1** and a site location plan is provided on **Figure 1**.

Table 1 Site location details

Site name	Shoot Up Hill, London
Full site address and postcode	Land to the rear 2-4 Shoot Up Hill, London, NW2 3QN
National Grid reference (centre of site)	524680E, 184680N

2.2 Site description

The site covers around 300 square metres, nearly rectangular in shape and is currently occupied by several outbuildings/sheds used as workshop and garages, with associated front drive and rear garden area. Access to the site is off Maygrove Road, which runs adjacent to the southern boundary.

Mature trees are present along the south western and northern site boundaries.

The site boundary and current site layout are shown on **Figure 2**.

2.3 Surrounding land uses

The site is located within the urban area of Kilburn, to the north of Maygrove Road and is immediately surrounded by residential properties and flats, with the wider site surroundings comprise a mixture of residential and commercial use.

Immediate surrounding land uses are described in **Table 2**.

Table 2 Surrounding land uses

North	Garden area and residential properties beyond.
East	Residential properties (terraced houses)
South	Maygrove Road and residential properties beyond
West	Garden area and residential flats beyond

2.4 Development plans

The site in question is being considered for redevelopment for residential end-use, by the demolition of the existed outbuildings/sheds, and the construction of a new four storey house. No basements are proposed.

3 DESK-BASED ASSESSMENT

3.1 Site history

3.1.1 Historical development record

The development history of the site and surrounding area based upon assessment of historical plans and records is detailed in **Table 3**. The historical maps reviewed are shown within the environmental database report in **Appendix C**.

Table 3 Summary of historical development

Date from	Date to	Historical Land Use (on-site)	Area of site
1873	1879	An open field, its boundary dissects the site east/west	southern third of the site
1896	1935	Rear garden of a residential development facing Edgware Road	western half
		End of terrace building with rear garden	eastern half
1935	Present	Two small unnamed structures assumed outbuildings/sheds	west
Date from	Date to	Historical Land Use (off-site)	Distance (m) and orientation
1873	1879	Small development named 'The Elms' and Midland Railway with associated railway sidings	approx. 100 m (N/NE)
		Shoot Up Hill and Edgware Road associated with County & Civil Parish boundary	approx. 50 m West
		Edgware Road Station on the Junction Railway	approx. 100 m South
1896	-	Metropolitan Railway extension (bridge crossing)	approx. 35 m South
		Nursery and Kilburn and Brondesbury stations beyond	approx. 70 m West
		Maygrove Road adjacent to the south	adjacent to the south
		Increased regional residential and commercial development	surrounds (within 250 m of site)

1915	1935	Nursery approx. to the west no longer present	-
		Metropolitan railway expansion	approx. 35 m South
		Continued regional development	surrounds
1935	1954	Continued Metropolitan railway expansion (total of three bridge crossing)	approx. 35 m South
		Continued regional development	surrounds
1954	1955	Kilburn and Brondesbury station renamed to Kilburn station	approx. 75 m West
		Electrical sub-station and a telephone house north west of the site	approx. 70 m North
		Edgware Road renamed to Kilburn High Road	>50 m (NW)
1970	2020	No significant change	-
Relevant information sources: Historical OS maps <input checked="" type="checkbox"/> Town plans <input type="checkbox"/> Information from the Local Planning Authority <input type="checkbox"/> Aerial photography <input type="checkbox"/> Previous reports <input type="checkbox"/>			
<i>Note: Reference to published historical maps provides invaluable information regarding the land use history of the site, but historical evidence may be incomplete for the period pre-dating the first edition and between successive maps.</i>			

3.1.2 Unexploded ordnance

A review of publicly available unexploded ordnance (UXO) risk maps indicates that the site is located in an area with 'low' potential for wartime bombs to be present (Zetica, 2020).

3.2 Information from environmental database report

Relevant environmental permits and incidents detailed within the environmental database report (see **Appendix C**) are summarised below in **Table 4**.

Table 4 Summary of environmental permits, landfills and incidents

Data type	Entries on-site	Entries <250m from site	Entries >250m from site of relevance	Details
Agency and hydrological				

Data type	Entries on-site	Entries <250m from site	Entries >250m from site of relevance	Details
Environmental permits – incorporating Integrated Pollution Prevention and Control, Integrated Pollution Controls, Local Authority Integrated Pollution Prevention and Control	-	-	-	N/A
Enforcement and prohibition notices	-	-	-	N/A
Pollution incidents to controlled waters, Prosecutions relating to controlled waters, Substantiated pollution incident register, Water Industry Act referrals	-	-	2	958 m (SW) Unknown Sewage, Category 3 – Minor Incident 961 m (SW) Unknown Sewage, Category 3 – Minor Incident
Discharge consents	-	-	1	814 m N, Freshwater Stream/River, Status: Authorisation Revoked. Type: Trade Effluent
Registered radioactive substances	-	-	-	N/A
Landfill and waste				
Active landfills	-	-	-	N/A
Historic / closed landfills	-	-	-	N/A
Other waste management licences	-	-	-	N/A
Potentially in-filled land (pit, quarry, pond, marsh, river, stream, dock etc)	-	-	-	N/A
Hazardous substances/industrial land uses				
Control of Major Accident Hazards (COMAH) sites	-	-	-	N/A

Data type	Entries on-site	Entries <250m from site	Entries >250m from site of relevance	Details
Explosives sites, Notification of Installations Handling Hazardous Substances (NIHHS), Planning hazardous substance consents/enforcements	-	-	-	N/A
Contaminated land Part 2A register entries and notices	-	-	-	N/A
Contemporary trade directory entries.	-	41	255	Printers (Inactive – 21 m S), Garage services (Inactive – 25 m E), MOT Testing Centres (Active – 25 m E), Packing and Wrapping Equipment & Supplies (Inactive – 67 m S), Metal Workers (Inactive – 138 m S), Builders Merchants (Active – 166 m SE)
Fuel station entries	-	1	4	Shell Waitrose Sceptre, Petrol station, active (250 m W)
<i>Note: Entries have only been included within the table where they are located within a 250m radius of the site or, where they fall outside of this radius but are considered to comprise a significant entry.</i>				

3.2.1 Site services

Buried utility services and their backfill can provide preferential pathways for gas, vapour or groundwater to migrate along to another part of the site or to a receptor. They can also represent significant constraints to development.

Service plans obtained from utility companies either by RSK or the client are contained in **Appendix D**.

3.3 Site geology

3.3.1 Anticipated geological sequence

Published records (British Geological Survey, Sheet 256, North London, 2006) for the area and available historical borehole logs indicate the geology of the site to be characterised by the succession recorded in **Table 5**.

Table 5 Site geology

Strata	Description	Estimated thickness	Permeability
London Clay Formation	Blue to grey or grey to brown silty to very silty clay, clayey silt	Up to 80 m	Not permeable
Relevant information sources: BGS Geoindex <input checked="" type="checkbox"/> BGS borehole logs <input checked="" type="checkbox"/> Previous SI reports <input type="checkbox"/>			

With reference to the historical data there have clearly been some/several phases of construction on the site and therefore the presence of made ground should be expected.

3.3.2 Radon

The environmental database report indicates that the site is not located within an 'Affected Area' (one with 1% or more homes above the radon Action Level of 200 Bq m⁻³), and therefore the risk of significant ingress of radon into structures on-site is considered low. Therefore, no radon protection measures are considered necessary in the construction of non-domestic buildings.

3.4 Hydrogeology

A summary of the hydrogeological setting of the site, with respect to the anticipated geological sequence set out in Section 3.3 is presented below in **Table 6**.

Table 6 Summary of hydrogeological setting

Condition	Description
Aquifer characteristics	<p>The site is underlain by an unproductive strata relating to the London Clay Formation.</p> <p>Confined by the London Clay is a deep aquifer, comprising a sequence of deposits consisting of the lower part of the Lambeth Group and Thanet Sands (Basal Sands) and the White Chalk.</p> <p>The presence of low permeability clay at relatively shallow depths beneath the site, while restricting downwards migration, may increase the potential for lateral migration of shallow groundwater (and therefore mobile contamination, if present).</p>

Condition	Description
Depth to groundwater and flow	<p>The anticipated depth to the groundwater table estimated from the available BGS information is in the order of >80 m below ground level.</p> <p>In the absence of any recent site-specific groundwater data, an inferred south-easterly groundwater flow direction (following regional topography) towards the River Thames has been assumed.</p> <p>The presence of localised shallow perched water within the made ground deposits is anticipated and may locally influence inferred groundwater flow direction.</p>
Rising groundwater levels	The site does not lie within an area where exceptional foundations and basements (basements deeper than 20 m, or foundations between 30 mbgl and 50 mbgl) are potentially at risk from rising water levels in the deep aquifer.
Groundwater recharge/attenuation	Most of the site is currently covered with buildings and hardstanding and therefore this will limit infiltration to ground and groundwater recharge.
Historical implications for hydrogeology	No known culverted streams, locations of springs, ponds or wells on the site.
Licensed groundwater abstractions	The environmental database report indicates that there are no groundwater abstractions within a 2 km radius of the site.
Source protection zones	Information available in the Envirocheck report indicates that the site does not lie within a currently designated groundwater Source Protection Zone (SPZ).

3.5 Hydrology

A summary of the hydrology within the site area is summarised in **Table 7**.

Table 7 Summary of hydrology in site area

Condition	Description
Surface watercourses/features	<p>There are no ponds, streams or drainage ditches on or adjacent to the site.</p> <p>The nearest identified surface to the site is the River Thames, located some 6.5 km to the south east of the site.</p>
Surface water abstractions	There are no surface water abstractions identified by the environmental database, within a 2 km radius of the site.
Site drainage	The site is predominantly covered in hardstanding (concrete). As a result, surface drainage from the site appears to be discharged into drainage system (gullies, catch pits).
Preliminary flood risk assessment	The indicative floodplain map for the area, shows that the site does not lie within a designated floodplain of a river or sea.

3.6 Sensitive land uses

Table 8 provides a summary of any environmentally sensitive areas identified within 500 m of the site based on the environmental database report.

Table 8 Environmentally sensitive areas

Feature	Present within 500m of site?	Details	Likely pathways from site?
International designations – Ramsar wetland, Special Area of Conservation (SAC), Special Protection Area (SPA)	No	N/A	N/A
National designations – Site of Special Scientific Interest (SSSI), National Nature Reserve (NNR), ancient woodland	No	N/A	N/A
Local designations – Local Nature Reserve, Site of Importance for Nature Conservation (SINC)	No	N/A	N/A
Nearest high sensitivity development, e.g. residential	N/A	N/A	N/A

4 SITE RECONNAISSANCE FINDINGS

A site reconnaissance survey was completed on 9th June 2020 by RSK. The characteristics of the site observed during the walkover and from current ordnance Survey maps are summarised in **Table 9**.

A site layout plan is provided in **Figure 2** with photographic records included in **Appendix E** detailing the main features identified below.

Whilst the walkover summary includes consideration of current operations and housekeeping on the site as potential sources of contamination, it does not constitute a comprehensive environmental audit of the site, as covered under ISO 14001.

Table 9 Site reconnaissance findings

Feature	Description
Physical characteristics	
Access constraints	Access only available in the front yard, no access in the workshops No parking on site.
Site topography	Site is essentially level.
Surface cover	The entire area of the site is covered by hardstanding (concrete).
Site drainage	Surface water drains into sewage via gullies.
Surface water	There are no streams or drainage ditches on or adjacent to the site.
Trees and hedges	None on site, but mature trees are present in neighbouring yards (to the south west and north of the site).
Invasive species	Based upon the walkover survey obvious evidence of Japanese Knotweed or other invasive species has not been identified on-site. However, it should be noted that a detailed survey of the possible presence or absence of invasive species is outside of the scope of investigation and consideration should be given to commissioning a specialist survey, as necessary.
Existing buildings on-site	Two sheds are in the northern and north western parts of the site.
Retaining walls and adjacent buildings on or close to site boundary	None recorded.
Basements on-site	No evidence of existing or infilled basements was observed.
Made ground, earthworks and quarrying	None observed, but likely to be present with variable thickness.

Feature	Description
Potentially unstable slopes on or close to site	None observed.
Buried and overhead services present	There are several manholes covers on site.
Environmental characteristics	
Underground/ above ground storage tanks and pipework	None observed.
Potentially hazardous materials storage and use	The two sheds are used as workshops with a number of fuel and oil-based chemicals, several old car batteries and industrial tools are stored within.
Asbestos-containing materials	No obvious asbestos construction materials were observed but a detailed survey of the outbuildings would be required to confirm the presence or otherwise of asbestos-containing materials.
Waste storage	None observed on site, however, immediately outside to the south there are general waste bins. At the time of the visit the bins were full, with some of the waste left outside.
Fly-tipping	None observed.
Electricity sub-stations/ transformers	None observed on or close to site.
Evidence of possible land contamination on-site	No obvious evidence noted, but possibly some spills from the chemicals stored in the workshops.
Potential off-site sources of ground contamination	Immediate surroundings are residential, with Kilburn Railway Station beyond to the west.

5 PRELIMINARY GEOTECHNICAL CONSTRAINTS

5.1 Design class

BS EN 1997-1 defines three different Geotechnical Categories that structures may fall into, which are summarised as follows:

- Category 1: Small and relatively simple structures for which it is possible to ensure that the fundamental requirements will be satisfied on the basis of experience and qualitative geotechnical investigations; with negligible risk.
- Category 2: Conventional types of structure and foundation with no exceptional risk or difficult ground or loading conditions.
- Category 3: Structures or part of structures, which fall outside limits of Geotechnical Categories 1 and 2. Examples include very large or unusual structures; structures involving abnormal risks, or unusual or exceptionally difficult ground or loading conditions; structures in highly seismic areas; structures in areas of probable site instability or persistent ground movements that require separate investigation or special measures.

Based on the information provided above on the proposed development and in view of the anticipated ground conditions, a Geotechnical Category 2 has been assumed for the purposes of designing the geotechnical investigation. This should be reviewed at all stages of the investigation and revised where necessary.

5.2 Preliminary geotechnical hazards assessment

A summary of commonly occurring geotechnical hazards associated with the anticipated geology outlined in Section 3 above is given in **Table 10** together with an assessment of whether the site may be affected by each of the stated hazards.

Table 10 Summary of preliminary geotechnical risks that may affect site

Hazard category	Hazard status based on desk study findings and proposed development		Engineering considerations if hazard affects site
	Could be present and/or affect site	Unlikely to be present and/or affect site	
Sudden lateral changes in ground conditions	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Likely to affect ground engineering and foundation design and construction
Shrinkable clay soils	<input checked="" type="checkbox"/>	<input type="checkbox"/>	Design to NHBC Standards Chapter 4 or similar

Hazard category	Hazard status based on desk study findings and proposed development		Engineering considerations if hazard affects site
	Could be present and/or affect site	Unlikely to be present and/or affect site	
Highly compressible and low bearing capacity soils, (including peat and soft clay)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	Likely to affect ground engineering and foundation design and construction
Silt-rich soils susceptible to rapid loss of strength in wet conditions	<input checked="" type="checkbox"/>	<input type="checkbox"/>	Likely to affect ground engineering and foundation design and construction
Running sand at and below water table	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Likely to affect ground engineering and foundation design and construction
Karstic dissolution features (including 'swallow holes' in Chalk terrain)	<input type="checkbox"/>	<input checked="" type="checkbox"/>	May affect ground engineering and foundation design and construction – refer to Section 4.1.2
Evaporite dissolution features and/or subsidence	<input type="checkbox"/>	<input checked="" type="checkbox"/>	May affect ground engineering and foundation design and construction
Ground subject to or at risk from landslides	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Likely to require special stabilisation measures
Ground subject to periglacial valley cambering with gulls possibly present	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Likely to affect ground engineering and foundation design and construction
Ground subject to or at risk from coastal or river erosion	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Likely to require special protection/stabilisation measures
High groundwater table (including waterlogged ground)	<input type="checkbox"/>	<input checked="" type="checkbox"/>	May affect temporary and permanent works
Rising groundwater table due to diminishing abstraction in urban area	<input type="checkbox"/>	<input checked="" type="checkbox"/>	May affect deep foundations, basements and tunnels
Underground mining	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Likely to require special stabilisation measures
Effects of extreme temperature (e.g. cold stores or brick kilns/furnaces)	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Likely to affect ground engineering and foundation design and construction
Existing sub-structures (e.g. tunnels, foundations, basements, and adjacent sub-structures)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	Likely to affect ground engineering and foundation design and construction

Hazard category	Hazard status based on desk study findings and proposed development		Engineering considerations if hazard affects site
	Could be present and/or affect site	Unlikely to be present and/or affect site	
Filled and made ground (including embankments, infilled ponds and quarries)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	Likely to affect ground engineering and foundation design and construction
Adverse ground chemistry (including expansive slags and weathering of sulphides to sulphates)	<input checked="" type="checkbox"/>	<input type="checkbox"/>	May affect ground engineering and foundation design and construction
Site topography	<input type="checkbox"/>	<input checked="" type="checkbox"/>	May affect ground engineering and foundation design and construction
Note: Seismicity is not included in the above table as this is not normally a design consideration in the UK.			

6 INITIAL CONCEPTUAL SITE MODEL

In line with CLR11 (Environment Agency, 2004) and BS 10175: 2011 + A2 2017 (BSI, 2017), RSK has used information in the preceding sections to identify sources of contaminants, receptors that may be impacted and plausible linking pathways. Where all three are present this is termed a potentially complete contaminant linkage and a qualitative risk estimation is made.

6.1 Potential soil, soil vapour and groundwater linkages

6.1.1 Potential sources of contamination

Potential sources of soil and groundwater contamination identified from current activities and the history of the site and surrounding area are presented in **Table 11**. Ground gas sources are addressed in the next section.

Table 11 Potential sources of soil and groundwater contamination

Potential sources	Contaminants of concern	Current or historical?
On-site		
Made ground (i.e. fill material associated with past and present development)	Unknown fill material but potentially including brick, ash and clinker and containing toxic and phytotoxic metals, inorganics, polycyclic aromatic hydrocarbons (PAHs), asbestos	Current/ Historical
Old car batteries and industrial tools	Metals such as acid, lead, lithium, nickel and mercury	Current
Off-site		
Petrol filling station, some 100 m south-west.	Petroleum hydrocarbons, fuel additives, PAHs, chlorinated solvents, asbestos	Current/ Historical
Made ground associated with LUL Kilburn station (some 80 m west)	Unknown fill material but potentially including brick, ash and clinker and containing toxic and phytotoxic metals, inorganics, polycyclic aromatic hydrocarbons (PAHs), asbestos Ground gas	Current/ Historical

6.1.2 Sensitive receptors and linking exposure/migration pathways

Sensitive receptors identified at or in the vicinity of the site that could be affected by the potential sources identified above comprise:

- future site users – residential [oral, dermal and inhalation exposure with impacted soil, soil vapour and dust/fibres];

- current adjacent site users – residential and commercial properties [migration of contamination via dust/fibre deposition combined with inhalation];
- existing and future vegetation [direct contact with contaminated soils or groundwater and root uptake leading to phytotoxicity];
- future buildings and services [direct contact with contaminated soils or groundwater and chemical attack, migration and ingress of ground gases into buildings, build-up in confined spaces and explosion].

Potential linking pathways are shown in brackets for each item above.

Please note that construction workers and future maintenance workers have not been identified in the conceptual model as receptors because risks are considered to be managed through health and safety procedures according to the CDM Regulations.

6.2 Preliminary risk assessment

The preliminary risk assessment findings and potentially complete contaminant linkages are shown in **Table 12** overleaf. The risk classification based on the combination of hazard consequence and probability using a risk matrix from CIRIA C552 (Rudland et al., 2001), a summary of which is included in **Appendix F**.

Table 12 Risk estimation for potentially complete contaminant linkages

Potential source	Potential receptor	Possible pathway	Likelihood	Severity	Potential risk	Justification
<p>Made ground (i.e. fill material associated with past and present development)</p> <p>Old car batteries and industrial tools</p>	Future site users	Oral, dermal and inhalation exposure with impacted soil, soil vapour and dust/fibres	Low-likelihood	Medium	Moderate/Low	<p><i>Low-likelihood</i> assigned on the basis that most if not all fly-tipped materials are likely to be removed from site as part of the proposed development plans.</p> <p><i>Medium</i> severity conservatively assigned given absence of any chemical/physical data/characteristics of deposited materials.</p>
	Current and future adjacent site users	Dust/fibre deposition, combined with inhalation	Unlikely	Medium	Low	<p><i>Unlikely</i> assigned on the basis that fly-tipped materials are likely to be removed adopting industry best-practice and guidance with regards to dust suppression, avoiding the mobilising of any potential airborne contaminants.</p> <p><i>Medium</i> severity conservatively assigned given absence of any chemical/physical data/characteristics of deposited materials.</p>
	Future buildings and services	Direct contact with contaminated soils or groundwater and chemical attack	Likely	Medium	Moderate	<p><i>Likely</i> conservatively assigned given the potential future contact as the depths/ designs of infrastructure is currently unknown.</p> <p><i>Medium - severity</i> conservatively assigned given unknown extent and chemical composition of underlying Made Ground.</p>

Potential source	Potential receptor	Possible pathway	Likelihood	Severity	Potential risk	Justification
	Existing/ future vegetation	Direct contact with contaminated soils or groundwater and root uptake leading to phytotoxicity	Low-likelihood	Medium	Moderate/Low	<p><i>Low-likelihood</i> assigned on the basis that most if not all fly-tipped materials are likely to be removed from site as part of the proposed development plans. In addition, there are no existing superficial signs of vegetative distress that could be attributed to phytotoxic conditions.</p> <p><i>Medium</i> severity conservatively assigned given absence of any chemical/physical data/characteristics of deposited materials.</p>
Hazardous Ground Gases – including carbon dioxide, methane and volatile organic compounds (VOCs)	Future site users Future buildings and services	Inhalation – via migration through geology/made ground, construction joints/cracks or services	Unlikely	Severe	Moderate/Low	<p><i>Unlikely</i> - due to proposed of deep basement which will effectively remove the made ground, with potentially remaining made ground fully encapsulated by the basement structure.</p> <p><i>Severe</i> - severity assigned given the potential for explosive atmosphere and/or asphyxiation</p>
Risk matrix		Consequences				
		Severe	Medium	Mild	Minor	
Probability	Highly likely	Very high	High	Moderate	Moderate/low	
	Likely	High	Moderate	Moderate/low	Low	
	Low likelihood	Moderate	Moderate/low	Low	Very low	
	Unlikely	Moderate/low	Low	Very low	Very low	

The preliminary Conceptual Site Model (CSM) identified evidence of possible ground contamination on the site, possible pathways for contamination to migrate and sensitive receptors potentially at risk. On that basis, possible pollutant linkages are therefore deemed to exist.

Potentially complete contaminant linkages with a potential risk of moderate to low or higher identified in in **Table 12** comprise:

- Direct contact (oral, dermal, inhalation) with potential contaminants associated with Made Ground by future site users;
- Direct contact (chemical attack) with potential contaminants associated with Made Ground by future buildings and services;
- Direct contact (plant uptake) with potential contaminants associated with Made Ground by existing / future vegetation;
- Inhalation of hazardous ground gases by future site users/ accumulation in future buildings and services generated by underlying Made Ground.

6.3 Data gaps and uncertainties

Key data gaps and uncertainties identified in the CSM at desk study stage include:

- gaps in available historical OS maps between 1991 to 1999;
- presence /absence and physical/chemical nature of any underlying made ground;
- there are no previous investigations available for the site, therefore no information on actual concentrations of contaminants in soil and groundwater or ground gas at this stage; and
- depth to / flow direction / chemical composition of groundwater (perched or otherwise).

7 SITE INVESTIGATION STRATEGY & METHODOLOGY

7.1 Introduction

RSK carried out intrusive investigation works between 14th and 15th July 2020 and subsequent monitoring of boreholes between 22nd and 27th July 2020.

7.2 Objectives

The specific objectives of the investigation were as follows:

- to establish the ground conditions underlying the site including the extent and thickness of any made ground;
- to investigate potential pollutant linkages identified in initial CSM;
- to determine the ground gas regime underlying the site; and
- to assess geotechnical properties of soils.

7.3 Investigation methods and strategy

The techniques adopted for the investigation were chosen with consideration of the objectives and site constraints, which are described below.

Prior to conducting intrusive works, utility service plans, a topographical and a full PAS 128 utility surveys were provided by the client. In addition, and in line with RSK's health and safety procedures, a service clearance by ground penetrating radar was carried out at each investigation location, followed by a cable avoidance tool (CAT) scan by the RSK supervising engineer.

The investigation strategy was chosen to provide information of ground conditions and sufficient geotechnical information in relation to the development proposals, while the investigation related to contamination purposes was designed to be non-targeted, characterising the made ground and the soils within the upper 1.5 m for contamination. Whilst every attempt was made to record full details of the strata encountered in the borehole, techniques of hole formation and sampling will inevitably lead to disturbance, mixing or loss of material in some soils and rocks.

The techniques adopted for the investigation were chosen with consideration of the objectives and site constraints. Due to restricted access a combined window sapling and rotary flight auger rig was used to obtain in-situ geotechnical data of the deeper strata, to collect both disturbed and undisturbed samples and install monitoring wells. Hand dug trial pits were selected to determine depths and makeup of the foundations to the neighbouring party wall, and to collect environmental samples from across the site.

Details of the investigation locations, installations and rationale are presented in **Table 13**.

Table 13 Exploratory hole and monitoring well location rationale

Investigation type	Number	Designation	Monitoring well installation	Rationale examples below
Boreholes by windowless sampling and rotary flight auger methods	1	BH1	Gas/ groundwater	To prove the shallow and deep geological succession beneath the site and obtain geotechnical data. To allow installation of groundwater and ground gas monitoring wells.
Trial-pits excavated by hand	2	TP1 to TP2	N/A	To prove the shallow geological succession beneath the site. To provide information type and depths of the foundations to existing structures.
Ground gas and groundwater monitoring	1	BH1	n/a	To determine the ground gas conditions beneath the site. To obtain information on groundwater levels.

7.3.1 Implementation of investigation works

The exploratory holes were logged by an engineer in general accordance with the recommendations of BS 5930:2015 (which incorporates the requirements of BS EN ISO 14688-1, 14688-2 and 14689-1).

The monitoring well construction and associated response zones are detailed on the exploratory hole records in **Appendix G**. The response zones were installed to target identified gas generation sources or migration pathways detailed in the initial preliminary CSM.

The soil sampling and analysis strategy was designed to characterise each encountered soil strata, permit an assessment of the potential contaminant linkages identified and investigate the geotechnical characteristics of the shallow and deep soils. In addition, samples were taken to allow for geo-environmental and geotechnical testing to be undertaken.

Soils collected for laboratory analysis were placed in a variety of containers appropriate to the anticipated testing suite required. They were dispatched to the laboratory in cool boxes under chain of custody documentation. Samples were stored in accordance with the RSK quality procedures to maintain sample integrity and preservation and to minimise the chance of cross contamination.

7.4 Monitoring programme

7.4.1 Ground gas monitoring

Two monitoring rounds have been undertaken to provide confirmatory data in support of the anticipated 'low' ground gas generation potential of the underlying soils, as identified within the initial conceptual site model.

An infrared gas meter was used to measure gas flow, concentrations of carbon dioxide (CO₂), methane (CH₄) and oxygen (O₂) in percentage by volume, while hydrogen sulphide (H₂S) and carbon monoxide (CO) were recorded in parts per million.

The atmospheric pressure before and during monitoring, together with the weather conditions, were recorded. The monitoring included periods of falling atmospheric pressures and after/during rainfall.

All ground gas monitoring results together with the temporal conditions are contained within **Appendix H**. Equipment calibration certificates are available on request.

7.4.2 Groundwater monitoring

Two rounds of groundwater monitoring using an electronic dip meter were undertaken during the ground gas monitoring visits. The monitoring records, including dates, are shown in **Appendix H**.

7.5 Laboratory testing

Laboratory testing was undertaken at a UKAS accredited laboratory with ISO17025 and MCERTS accredited test methods were specified where applicable for contamination testing and as shown in the laboratory test certificates appended.

7.5.1 Chemical analysis of soil samples

The soil sampling strategy was designed to characterise made ground and/or natural strata typically within the upper 1.10 m of the ground profile whilst also characterising deeper strata and the potential for contaminant migration from relevant sources of identified within the preliminary CSM.

The programme of chemical tests undertaken on soil samples obtained from the intrusive investigation is presented in **Table 14** with the laboratory testing results contained in **Appendix I**.

Table 14 Summary of chemical testing of soil samples

Stratum	Tests undertaken	No. of tests
Made ground	Metals: As, Cd, Cr, Cu, Hg, Pb, Ni, Se, Zn	3
	Asbestos screening and ID	3
	TPH Total	2
	TPH CWG plus BTEX and MTBE	1
	Full 1 batch waste suite	1

Stratum	Tests undertaken	No. of tests
	Speciated PAH EPA16	3
	TOC	2

7.5.2 Geotechnical analysis of soils

Disturbed, bulk and undisturbed soil samples were taken for geotechnical classification testing with the depth and nature of samples detailed within the exploratory hole records.

Where appropriate, testing was undertaken in accordance with BS 1377:1990 Method of Tests for Soils for Civil Engineering Purposes or, where superseded, by the relevant part of BS EN ISO 17892:2014 Geotechnical investigation and testing - Laboratory Testing of Soil. Tests carried out in order to classify the concrete class required on-site have been undertaken following the procedures within BRE SD1:2005.

The programme of geotechnical tests undertaken on samples obtained from the intrusive investigation is presented in **Table 15**. The results and UKAS accreditation of tests methods are shown in **Appendix J**.

Table 15 Summary of geotechnical testing undertaken

Strata	Tests undertaken	No. of tests
London Clay Formation	Natural Moisture Content	5
	Liquid and Plastic Limits	5
	Quick Undrained Single Stage Triaxial Test	3
	BRE SD1 Suite Pyritic Soil - pH BRE, ws SO ₄ BRE, acid sol SO ₄ , Total SO ₄ BRE, Total S BRE	5

8 SITE INVESTIGATION FACTUAL FINDINGS

The results of the intrusive investigation and subsequent geo-environmental and geotechnical laboratory analysis undertaken are detailed below.

8.1 Ground conditions encountered

The descriptions of the strata encountered, notes regarding visual or olfactory evidence of contamination, list of samples taken, field observations of soil and groundwater, in-situ testing and details of monitoring well installations are included on the exploratory hole records presented in **Appendix G**.

The exploratory holes revealed that the site is underlain by a variable thickness of made ground over London Clay Formation encountered at depth. This appears to confirm the stratigraphically succession described within the preliminary CSM.

For the purpose of discussion, the ground conditions encountered during the fieldworks are summarised in **Table 16** with the strata discussed in subsequent subsections.

Table 16 General succession of strata encountered

Stratum	Exploratory holes encountered	Depth to top of stratum m bgl	Proven thickness (m)
Hardstanding	All	G. L	0.10 to 0.15
Made Ground		0.10 to 0.15	0.80 to 1.22
London Clay Formation		0.94 to 1.32	13.80 (proven only in BH1)

8.1.1 Hardstanding / made ground

Beneath the 0.10 m to 0.15 m thick concrete surface, the made ground was encountered at all investigation locations, its thickness varying from 0.80 mbgl to 1.22 mbgl. The greater thickness of made ground was recorded within TP1.

The stratum encountered as dark brown, very gravelly sand with brick, flint and concrete grading into mottled, slightly silty, gravelly clay with depth. Detailed descriptions of the materials encountered during the works are given on boreholes and trial pit logs in **Appendix G**.

Owing to the variable nature and unknown provenance of made ground it is likely that the made ground has not been engineered.

8.1.2 London Clay Formation

The London Clay Formation was encountered beneath the made ground and was proven to the terminal depth of the investigation.

The stratum compromised initially stiff, medium to high strength, brown, slightly sandy, very silty clay, becoming stiff to very stiff, high to very high strength, light brown, thinly laminated, slightly silty clay with fine pyrite crystals and selenite crystals.

A summary of the in-situ and laboratory test results recorded in the stratum are presented in **Table 17**.

Table 17 Summary of in-situ and laboratory test results for London Clay Formation

Soil parameters	Min. Value	Max. Value	Reference
Moisture content (%)	27	42	Appendix J
Modified moisture content (%)	27	42	-
Liquid limit (%)	74	83	Appendix J
Plasticity limit (%)	28	33	
Plasticity index (%)	46	50	
Modified plasticity index (%)	46	50	
Plasticity term	Very High		-
Volume change potential	High		
SPT 'N' values	15	36	Appendix G
Undrained shear strength inferred from SPT 'N' values (kN/m ²) *	65	155	-
Undrained shear strength measured by shear vane testing (kN/m ²)	60	>140	Appendix J
Undrained shear strength measured by triaxial testing (kN/m ²)	116	160	
Consistency term from field description	Stiff	Very Stiff	-
Strength term	Medium	Very High	
Notes: *derived using a Stroud Factor of 4.3			

8.2 Foundation pits

Two trial pits were undertaken by hand excavation to determine foundation configurations of the neighbouring house.

Trial pit TP1 was excavated against the neighbouring party wall. The external brick wall at this location was founded on a two corbels foundation at a depth of 0.95 mbgl, projecting some 130 mm from the wall and resting at 1.32 mbgl, on firm light brown, brown, mottled, slightly sandy, very silty clay (London Clay Formation).

Trial pit TP2 was excavated against the neighbouring wall fence. The pit encountered a single corbel foundation at a depth of 0.86 mbgl, projecting some 50 mm from the external wall and resting within the London Clay Formation of firm light brown, mottled slightly sandy, very silty clay, at 0.94 mbgl.

Details of the exposed foundation are given in **Appendix G**.

8.2.1 Visual/olfactory evidence of soil contamination

A slight hydrocarbon odour was encountered within the underlying made ground at location BH1 (1.10 mbgl), potentially associated with car maintenance works within the site.

8.3 Groundwater

Groundwater was not encountered during the investigation works. Groundwater levels recorded during the monitoring programme are summarised in **Table 18** based on the data provided in **Appendix H**.

Table 18 Summary of groundwater monitoring results

Monitoring well	Response zone stratum	Round 1 (22/07/2020)	Round 2 (27/07/2020)
		Groundwater depth (m bgl)	
BH1	MG/LCF	1.74	1.03
Notes: MG – Made Ground, LCF – London Clay Formation			

The results recorded a shallow groundwater level at the interface between the made ground and London Clay Formation, which is considered to be perched only.

8.3 Chemical laboratory results

No exceedances were noticed within the soil samples tested. The results of the chemical testing are presented in **Appendix I** and further discussed in Section 9.

8.4 Geotechnical laboratory results

The results of the geotechnical testing are discussed in Section 11 and presented in **Appendix J**.

8.5 Ground gas monitoring

The results of the ground gas monitoring and testing carried out are given in **Appendix H** and discussed in section 9.

9 GEO-ENVIRONMENTAL ASSESSMENT

9.1 Refinement of initial CSM

The ground conditions encountered during the site investigation generally confirmed the preliminary CSM. Made ground was found at all locations over the natural bedrock geology of the London Clay Formation.

Hydrocarbons odours were noted within BH1 which could potentially be linked with above ground sources, namely car maintenance works.

As stated in previous sections, the proposed development on site, which will incorporate excavation of a basement and areas of hardstanding will effectively remove any significant contamination if present and/or break potential pathways between any potential contamination and future site users. The only potential linkage that exists for a potentially contaminated made ground to be contact with structures and buried services.

With respect to ground gas, very little degradable material was noted within the underlying soils, confirming the anticipated low ground gas generation within the made ground. Flow rates in all of the exploratory holes are negligible (0.0l/hr).

Therefore, chemical testing was carried out was for the purpose of classifying the material for waste disposal (Section 7), and assessing the risk to buried infrastructure, while the assessment related to the risk to human health is only confirmatory.

9.2 Linkages for assessment

In line with CLR11 (Environment Agency, 2004), there are two stages of quantitative risk assessment, generic (GQRA) and detailed (DQRA). The GQRA comprises the comparison of soil, groundwater, soil gas and ground gas results with generic assessment criteria (GAC) that are appropriate to the linkage being assessed. This comparison can be undertaken directly against the laboratory results or following statistical analysis depending upon the sampling procedure that was adopted.

Following the refinement of the initial CSM, the potentially complete contaminant linkages that require further assessment and the methodology of assessment are presented in **Table 19**.

Table 19 Linkages for GQRA

Potentially relevant contaminant linkage	Assessment method
Soil	
1. Oral, dermal and inhalation exposure with impacted soil, soil vapour and dust by future residents	Human health GAC in Appendix K for a proposed residential end use with home-grown produce as the most conservative scenario.
2. Inhalation exposure of future residents to asbestos fibres	Qualitative assessment based on the asbestos minerals present, their form, concentration, location and the nature of the proposed development.

Potentially relevant contaminant linkage	Assessment method
3. Contaminants permeating potable water supply pipes	Comparison of soil data to GAC in Appendix L for plastic water supply pipes using UKWIR (2010) guidance.
4. Leaching of soil contaminants and dissolved phase migration	Since no leachate data is available the potential for leaching has been considered qualitatively using soil and groundwater results.
5. Uptake of contaminants by vegetation potentially impacting plant growth (phytotoxicity)	Comparison of soil data to GAC in Appendix M for phytotoxicity.
Ground Gas	
6. Concentrations of methane and carbon dioxide in ground gas entering and accumulating in enclosed spaces or small rooms in new buildings, which could affect future site users. For methane this could create a potentially explosive atmosphere, while death by asphyxiation could result from carbon dioxide.	Gas screening values (GSV) have been calculated using maximum methane and carbon dioxide concentrations with maximum flow rates recorded at the site. The GSV have been compared with the revised Wilson and Card classification presented in BS8485.

9.3 Methodology and assessment of soil results

The analysis of laboratory results relating to soil samples submitted for testing, including leachate analysis, is included in the following sections.

9.3.1 Oral, dermal and inhalation exposure with impacted soil by future occupants/site users

All results have been compared with the GAC for residential end use with home-grown produce end use scenario (**Appendix K**). A soil organic matter (SOM) of 1% has been conservatively selected.

Results indicate that all contaminants are below the relevant GAC therefore it is considered that a relevant contaminant linkage does not exist.

9.3.2 Inhalation exposure of future occupants/site users to asbestos fibres

The visual inspection at the laboratory identified no materials suspected of potentially containing asbestos and the scheduled laboratory screening for asbestos found no detectable asbestos fibres within the shallow soils.

Although ACM not detected within any of the soil samples submitted, taking into consideration the anticipated heterogeneity of underlying made ground, localised ACM cannot be ruled out entirely.

9.3.3 Impact of organic contaminants on potable water supply pipes

For initial assessment purposes, the results of the investigation have been compared with the GAC presented in **Appendix L** for this linkage, which are reproduced from *UKWIR*

Report 10/WM/03/21. Guidance for the Selection of Water Supply Pipes to be used in Brownfield Sites (UKWIR, 2010).

The results indicate that a relevant linkage is unlikely to exist associated with organic contaminants and therefore pollutant polyethylene (PE) and/or polyvinyl chloride (PVC) water supply pipes are expected to be suitable for use on the development.

It should be noted that at the time of this investigation the future routes of water supply pipes had not been established, hence the investigation and sampling strategy may not be fully compliant with UKWIR recommendations. Consequently, a targeted investigation and specific sampling/analytical strategy may be required at a later date once the route(s) of the supply pipe(s) are known. In addition, it is recommended that the relevant water supply company be contacted at an early stage to confirm its requirements for assessment, which may not necessarily be the same as those recommended by UKWIR.

9.3.4 Uptake of contaminants by vegetation potentially inhibiting plant growth (phytotoxicity)

All soil results have been directly compared against the GAC for phytotoxic effects (**Appendix M**)

The results indicate that a relevant contaminant linkage is unlikely to exist associated with phytotoxic effects.

9.4 Ground gas risk assessment

9.4.1 Appropriate guidance

The risks to development from ground gases have been assessed in accordance with BS8485:2015, which provides guidance on ground gas (methane and carbon dioxide) characterisation and hazard assessment, as well as a framework for the prescription of protection measures within new buildings.

The process involves characterising the gas hazard from combining the qualitative assessment of risk (using the conceptual site model) with ground investigation data so that a 'characteristic situation' (CS) can be derived for the site. Characteristic situations range from CS1 to CS6, the higher the CS the higher the hazard potential. Protection measures within new buildings can be prescribed using a point scoring system, taking into consideration the CS and the proposed building type.

BS8485 indicates that the gas hazard can be characterised using the following methods:

- an empirical semi-quantitative approach using gas monitoring data to determine the 'characteristic situation' of the site (or zones of the site) and subsequent protective measures (Wilson and Card approach);
- an empirical semi-quantitative approach using TOC data to determine the 'characteristic situation' of the site (or zones of the site) and subsequent protective measures (CL:AIRE RB17 approach), or
- detailed quantitative assessment methodologies.

For the purpose of this assessment, the first approach listed above has been used to characterise the gas hazard and provide advice on the protective measures likely to be required within new buildings at the site.

The empirical semi quantitative approach using gas monitoring data is based on calculations of the gas screening value (GSV). BS8485 defines the GSV as the ‘flow rate (l/hr) of a specific hazardous gas representative of a site or zone, derived from assessment of borehole concentration and flow rate measurements and taking account of all other influencing factors, in accordance with a conceptual site model’.

Once derived for both methane and carbon dioxide the GSVs are compared to the thresholds presented in Table 2 of BS8485, so that a CS can be determined for the site, or a zone. It is important to note that the GSV thresholds are guideline values and not absolute. The GSV thresholds may be exceeded in certain circumstances, if the site conceptual model indicates it is safe to do so. Similarly, consideration of additional factors such as very high concentrations of methane, should lead to consideration of the need to adopt a higher risk classification than the GSV threshold indicates.

The results of the ground gas monitoring and testing undertaken at the site are given in **Appendix H**. The maximum results recorded are presented in **Table 20**.

Table 20 Summary of ground gas monitoring results

Borehole	Response zone/ stratum	Probable source(s) of ground gas	Number of monitoring visits	Methane (%)	Carbon dioxide (%)	Oxygen (%)	Flow rate (l/hr)	Water level (m b TOC)	Atmospheric pressure (mbar)
BH1	MG/LCF	Made Ground	2	<0.1	0.3-0.8	20.3-22.1	<0.1	1.03-1.74	1003-1018
Note: MG – Made Ground, LCF – London Clay Formation									

BS8485 suggests that the GSV should be derived by multiplying the worse credible (worst case) recorded flow value in any standpipe in that strata or zone with the maximum gas concentration in any other standpipe in that strata or zone. Further guidance is given in BS8485 section 6.3.

Considering the assessment of the gas monitoring results the maximum GSVs derived for the both, methane and carbon dioxide are 0.1 l/hr.

Based on the calculated GSVs and the method for determining the CS presented within Table 2 of BS8485, the site has been characterised as CS1. Considering the foregoing and in accordance with BS8485, ground gas protective measures are not considered necessary within proposed buildings.

10 PRELIMINARY WASTE ASSESSMENT

In accordance with the definition provided in the Waste Framework Directive (WFD), materials are only considered waste if ‘they are discarded, intended to be discarded or required to be discarded, by the holder’. Naturally occurring soils are not considered waste if reused on the site of origin for the purposes of development. Soils such as made ground that are not of clean and natural origin (irrespective of whether they are contaminated or not) and other materials such as recycled aggregate, do not become waste until the criteria above are met. Further background information is provided in **Appendix F**.

Excavation arisings from the development may therefore be classified as waste if surplus to requirements or unsuitable for reuse. The following assessments assume the material tested is classified subsequently as waste.

RSK recommends that a Sampling Plan be prepared to support any waste classifications and hazardous waste assessments, prior to any material being excavated. Given the level of data obtained, scale of the development and heterogeneity of the site soils, the following assessment should be considered indicative and further assessment should be undertaken following the preparation of a waste sampling plan.

10.1 Hazardous waste assessment

Technical Guidance WM3 (EA, 2018) sets out in **Appendix F** requirements for waste sampling. It is a legal requirement to correctly assess and classify waste. The level of sampling should be proportionate to the volume of waste and its heterogeneity. The preliminary assessment provided below is based only upon the available sample results and may not be sufficient to adequately classify the waste.

10.1.1 Chemical contaminants

EnviroLab, an RSK company, has developed a waste soils characterisation assessment tool (HASWASTE), which follows the guidance within Technical Guidance WM3. The analytical results have been assessed using this tool to assess the hazardous properties to support potential off-site disposal of materials in the future are presented in **Appendix N**.

No samples were found to have hazardous properties based on this assessment. This suggests that if applicable the waste would require disposal at a suitably permitted inert or non-hazardous waste landfill.

10.1.2 Asbestos within waste soils

Technical Guidance WM3 requires that within a mixed waste the separately identifiable wastes be assessed separately.

For instance, where waste soil contains identifiable pieces of asbestos (visible to the naked eye) the asbestos should, where feasible, be separated from the soil and classified separately. This should be disposed of within a hazardous, stable non-reactive hazardous waste landfill or a special cell in a non-hazardous waste landfill.

Samples of potential asbestos containing material were collected from site and analysed for the presence of asbestos, the results of which are presented in **Appendix I**.

Analysis confirmed that asbestos is not present within samples and visible asbestos containing material was not identified on-site, therefore the waste can be disposed of within a non-hazardous waste landfill which is able to accept asbestos at non-hazardous concentrations.

10.2 WAC assessment

A single sample from the made ground in BH1 at 1.10 mbgl was submitted for waste acceptance criteria (WAC) testing, the results of which are presented in **Appendix I**.

The results identified concentrations of determinants below the inert criteria limits. As such, the made ground material can be disposed of as inert waste.

It is important to note that the assessment given in this report is for guidance only and it is always necessary to confirm the actual classification with prospective landfill operators

The natural soils are not considered to be contaminated and are therefore automatically classed as inert waste. Should visibly contaminated natural soils be encountered during development works, then they will require WAC testing to determine their waste classification.

11 GEOTECHNICAL ASSESSMENT

11.1 Proposed development

It is understood that the proposed development includes the demolition of the existing outbuildings/sheds, and the construction of a new four storey residential building.

At this stage no specific information relating to proposed structure and building loads has been provided.

11.2 Key geotechnical hazards/development constraints

The key risks identified from the available ground investigation data are discussed below:

- ***Potential for Shrinking or Swelling Clay Ground Stability Hazards***

The cohesive London Clay Formation is with high volume change potential. Given the presence of the clay soil at shallow depths, shrinking or swelling clay minerals is likely to be present across the site.

- ***Silt-rich soils susceptible to rapid loss of strength in wet conditions***

The London Clay Formation soils are with variable, and locally significant silt content.

- ***Filled and made ground***

Made ground was encountered across the entire site, locally up to 1.40 m thick.

- ***Existing sub-structures (e.g. tunnels, foundations, basements, and adjacent sub-structures)***

Allowance should be made for the removal of the foundations of existing outbuildings / sheds following demolition.

- ***Adverse ground chemistry (including expansive slags and weathering of sulphides to sulphates)***

The London Clay Formation is with high WSO₄ content (See Section 11.5).

11.3 Foundations

11.3.1 Foundation options

The ground conditions encountered beneath the site comprise variable thickness of made ground of up to 1.40 m below existing ground level, over initially stiff, slightly sandy, very silty clay, becoming, stiff to very stiff, high to very high strength, thinly laminated clay of the London Clay Formation, proven to the terminal depth of the investigation.

Groundwater was not recorded during the site investigation, with shallow perched water encountered during the monitoring at the interface between the made ground and the London Clay Formation, with the highest level of 1.03 mbgl.

As stated in previous sections, full details for the proposed development, including preferred foundation solution are not available, however, given the anticipated loading

from the proposed four storey building, it is considered that piled foundations will provide the most suitable foundation solution.

11.3.2 Piled foundations

Recommendations for the design and construction of pile foundations in relation to the ground conditions are set out in **Table 21**.

Table 21 Design and construction of piled foundations

	Design/construction recommendations	
Pile type and possible constraints	The construction of both bored and 'cfa' and driven piles is considered technically feasible at this site. Given the close proximity of the site to other properties, it is considered that the use of driven piles may not be acceptable due to the vibration, noise and heave associated with pile driving.	
Temporary casing	Given the potential presence of perched groundwater at the interface between the made ground and the London Clay Formation, bored piles may require temporary casing throughout their depth. Alternatively, the use of continuous-flight-auger (CFA) injected bored piles or driven piles usually overcomes this issue.	
Man-made obstructions	The presence of buried sub-structures or other obstructions within made ground may lead to some difficulty during piling. It is recommended that once the proposed pile layout has been determined, pre-pile probing be carried out at each of the pile positions. Where buried obstructions are encountered, it will be necessary to either relocate the pile(s) or make allowance for removing the obstruction.	
Hard strata	An allowance should be made for chiselling thin 'rock' bands (claystone) within the London Clay Formation.	
Pile design parameters for London Clay Formation	Undrained shear strength c_u (kN/m ²)	75+9z where z = depth into clay
	Adhesion factor α	0.5
	Bearing Capacity Factor (N_c)	9.0
General parameters	Maximum Limiting Shaft Friction	140 kN/m ²
	Average Limiting Shaft Friction	110 kN/m ²
	Limiting concrete stress (kN/m ²)	7.5N/mm ²
	Global margin of safety	2.6
Special precautions relating to bored pile shafts and bases	Bored pile concrete should be cast as soon after completion of boring as possible and in any event the same day as boring. Prior to casting the base of the pile bore should be clean, otherwise a reduced safe working load will be required. Similarly, if the pile bore is left open the shaft walls may relax/soften, leading to a reduced safe working load.	

The design procedure for piles varies considerably, depending on the proposed type of pile. However, for illustrative purposes **Table 21** gives likely working pile loads for

traditional bored, cast-in-situ concrete piles of various diameters and lengths, based on the design parameters given in **Table 22**. Please note that the above capacities are based on conservative shear strength of 175kPa adopted beyond the depth of investigation (below a depth of 15 mbgl).

Table 22 Illustration of typical pile working loads for bored cast-in-situ piles

Typical pile working loads (kN)						
Depth of pile below existing ground level (m)	Pile diameter					
	300 mm	350 mm	400 mm	450 mm	500mm	600mm
10	200	240	282	325	371	468
12.5	271	325	379	436	495	619
15	351	418	486	558	632	787
17.5 ¹⁾	430	510	593	677	765	946
20 ¹⁾	509	603	698	796	897	1105

¹⁾ pile length below the base of investigation

It should be stressed that the above capacities do not take into consideration pile group effects which is more pronounced for a large number of closely spaced piles.

Notwithstanding the above, it is recommended that the detailed advice of a specialist-piling contractor be sought as to the most suitable type of pile for the prevailing ground conditions and as to their lengths and diameters to support the required design loads.

11.4 Floor slabs

The site is generally underlain by more than 600 mm of existing made ground. National House-Building Council (NHBC) standards require that ground floor slabs should be suspended in areas where made ground is greater than 600 mm in thickness.

11.5 Chemical attack on buried concrete

This assessment of the potential for chemical attack on buried concrete at the site is based on BRE Special Digest 1: Concrete in aggressive ground, which represents the most up-to-date guidance on this topic currently available in the UK.

The desk study and site reconnaissance indicate that, for the purposes of assessing the aggressive chemical environment of the site, the site should be considered as comprising natural ground likely to contain pyrite.

Based on testing results, **Table 23** gives the characteristic pH, water-soluble and total sulphate content values for soils from each of the geological units and groundwater encountered on-site.

Table 23 Characteristic pH, water soluble sulphate and total sulphate values

Stratum	pH	Water Soluble Sulphate (mg/l)	Total Potential Sulphate (mg/l)
London Clay	7.69	3250	2.55

Based on the results above and following the steps outlined in the BRE guidance, the Design Sulphate Classes and Aggressive Chemical Environment for Concrete classifications are summarised in **Table 24**, on the basis of water soluble sulphate and total potential sulphate, respectively.

Table 24 Concrete design class

Stratum	Ground water	Water Soluble Sulphate		Total Potential Sulphate	
		DS Class	AC Class	DS Class	AC Class
London Clay Formation	Mobile	DS-4	AC-4	DS-5	AC-5

From consideration of results a Design Sulphate Class of DS-4 and Aggressive Chemical Environment for Concrete classification of AC-4 is indicated.

12 CONCLUSIONS AND RECOMMENDATIONS

12.1 Geo-environmental assessment

The results of the site investigation and GQRA indicate that relevant contaminant linkages are absent based on the data available and therefore the site is suitable for the proposed end use. Although not encountered to date, localised sources of contamination could still be present, although they are unlikely to be widespread.

Should unforeseen contamination be encountered during the development then specialist advice should be sought to determine the appropriate course of action.

Preliminary waste assessment classified the soils are not hazardous and likely to be suitable for disposal at an inert landfill or a site that has a valid exemption from the Environmental Permitting (England and Wales) Regulations 2016 (as amended) registered with the EA. WAC testing should be undertaken to confirm the classification for disposal.

The results of the initial ground gas risk assessment indicate the site has been characterised as CS1, follow the abovementioned no requiring ground gas protection measures needed.

12.2 Geotechnical assessment

The site investigation has confirmed the site to be underlain by variable thickness of made ground of up to 1.40 m below existing ground level, over stiff, medium to high strength, slightly sandy, very silty clay, becoming very stiff, high to very high strength, silty clay of the London Clay Formation.

Piled foundations are considered to be the most appropriate foundation solution for the proposed development.

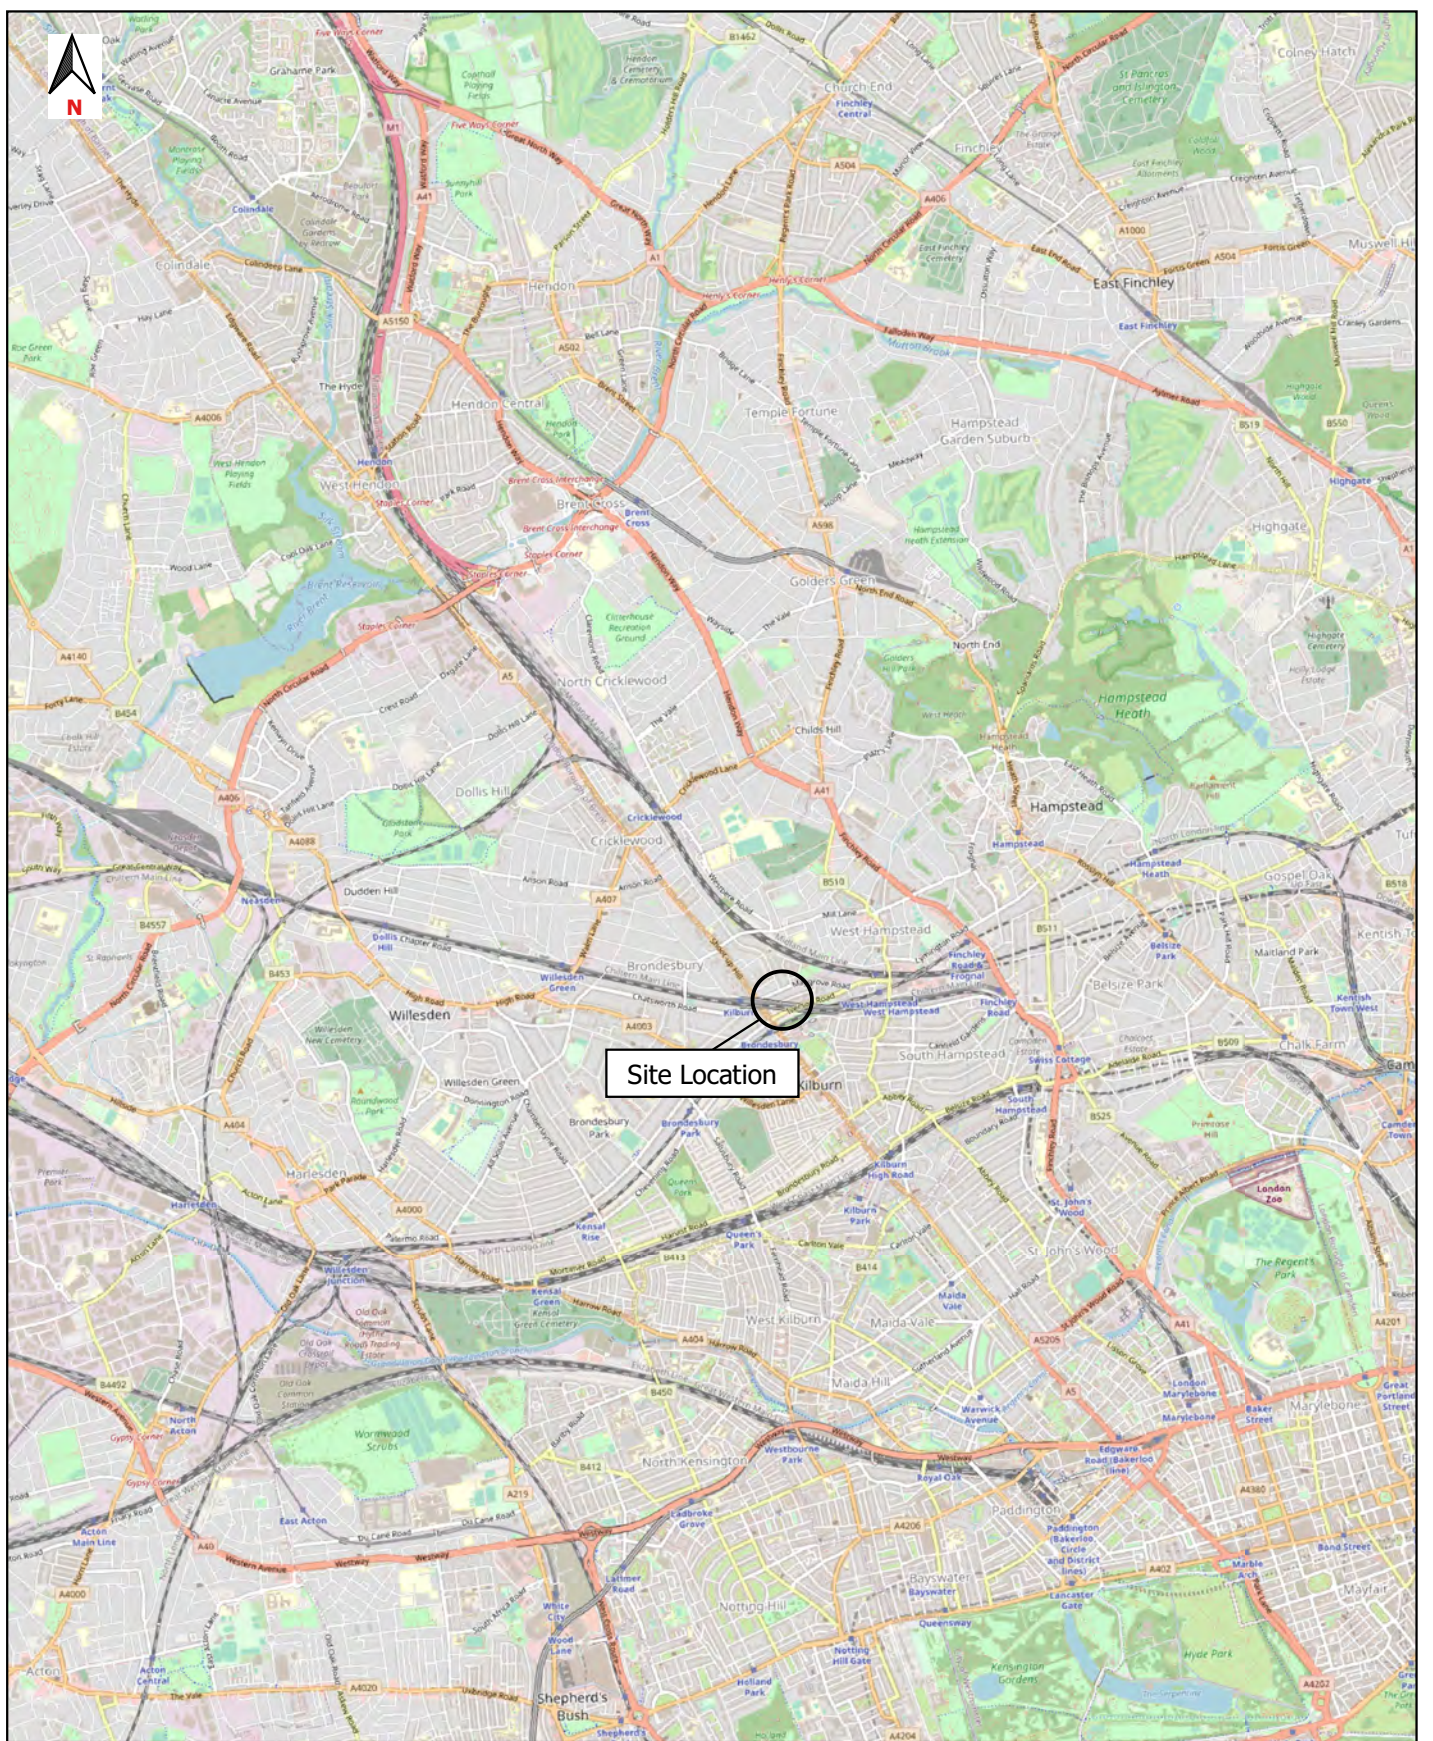

Ground floor slabs should be suspended.

The Design Sulphate Class within the London Clay Formation is DS-4 with an Aggressive Chemical Environment for Concrete classification of AC-4 can be adopted for the proposed development.

APPENDIX A

SERVICE CONSTRAINTS

1. This report and the site investigation carried out in connection with the report (together the "Services") were compiled and carried out by RSK Environment Limited (RSK) for (the "Client") in accordance with the terms of a contract between RSK and the Client, dated 29/07/2020. The Services were performed by RSK with the reasonable skill and care ordinarily exercised by an environmental consultant at the time the Services were performed. Further, and in particular, the Services were performed by RSK taking into account the limits of the scope of works required by the client, the time scale involved and the resources, including financial and manpower resources, agreed between RSK and the Client.
2. Other than that, expressly contained in paragraph 1 above, RSK provides no other representation or warranty whether express or implied, in relation to the Services.
3. Unless otherwise agreed in writing, the Services were performed by RSK exclusively for the purposes of the Client. RSK is not aware of any interest of or reliance by any party other than the Client in or on the Services. Unless expressly provided in writing, RSK does not authorise, consent or condone any party other than the client relying upon the Services. Should this report or any part of this report, or otherwise details of the Services or any part of the Services be made known to any such party, and such party relies thereon that party does so wholly at its own and sole risk and RSK disclaims any liability to such parties. **Any such party would be well advised to seek independent advice from a competent environmental consultant and/or lawyer.**
4. It is RSK's understanding that this report is to be used for the purpose described in the introduction to the report. That purpose was a significant factor in determining the scope and level of the Services. Should the purpose for which the report is used, or the proposed use of the site change, this report may no longer be valid and any further use of or reliance upon the report in those circumstances by the client without RSK 's review and advice shall be at the client's sole and own risk. Should RSK be requested to review the report after the date of this report, RSK shall be entitled to additional payment at the then existing rates or such other terms as agreed between RSK and the client.
5. The passage of time may result in changes in site conditions, regulatory or other legal provisions, technology or economic conditions which could render the report inaccurate or unreliable. The information and conclusions contained in this report should not be relied upon in the future without the written advice of RSK. In the absence of such written advice of RSK, reliance on the report in the future shall be at the Client's own and sole risk. Should RSK be requested to review the report in the future, RSK shall be entitled to additional payment at the then existing rate or such other terms as may be agreed between RSK and the client.
6. The observations and conclusions described in this report are based solely upon the Services which were provided pursuant to the agreement between the Client and RSK. RSK has not performed any observations, investigations, studies or testing not specifically set out or required by the contract between the client and RSK. RSK is not liable for the existence of any condition, the discovery of which would require performance of services not otherwise contained in the Services. For the avoidance of doubt, unless otherwise expressly referred to in the introduction to this report, RSK did not seek to evaluate the presence on or off the site of asbestos, invasive plants, electromagnetic fields, lead paint, heavy metals, radon gas or other radioactive or hazardous materials, unless specifically identified in the Services.
7. The Services are based upon RSK's observations of existing physical conditions at the Site gained from a visual inspection of the site together with RSK's interpretation of information, including documentation, obtained from third parties and from the Client on the history and usage of the site, unless specifically identified in the Services or accreditation system (such as UKAS ISO 17020:2012 clause 7.1.6):

- a. The Services were based on information and/or analysis provided by independent testing and information services or laboratories upon which RSK was reasonably entitled to rely.
- b. The Services were limited by the accuracy of the information, including documentation, reviewed by RSK and the observations possible at the time of the visual inspection.
- c. The Services did not attempt to independently verify the accuracy or completeness of information, documentation or materials received from the client or third parties, including laboratories and information services, during the performance of the Services.

RSK is not liable for any inaccurate information or conclusions, the discovery of which inaccuracies required the doing of any act including the gathering of any information which was not reasonably available to RSK and including the doing of any independent investigation of the information provided to RSK save as otherwise provided in the terms of the contract between the Client and RSK.

8. The intrusive environmental site investigation aspects of the Services are a limited sampling of the site at pre-determined locations based on the known historic / operational configuration of the site. The conclusions given in this report are based on information gathered at the specific test locations and can only be extrapolated to an undefined limited area around those locations. The extent of the limited area depends on the properties of the materials adjacent and local conditions, together with the position of any current structures and underground utilities and facilities, and natural and other activities on site. In addition, chemical analysis was carried out for a limited number of parameters (as stipulated in the scope between the client and RSK, based on an understanding of the available operational and historical information) and it should not be inferred that other chemical species are not present.
9. Any site drawing(s) provided in this report is (are) not meant to be an accurate base plan but is (are) used to present the general relative locations of features on, and surrounding, the site. Features (intrusive and sample locations etc) annotated on site plans are not drawn to scale but are centred over the approximate location. Such features should not be used for setting out and should be considered indicative only.
10. The comments given in this report and the opinions expressed are based on the ground conditions encountered during the site work and on the results of tests made in the field and in the laboratory. However, there may be conditions pertaining to the site that have not been disclosed by the investigation and therefore could not be taken into account. In particular, it should be noted that there may be areas of made ground not detected due to the limited nature of the investigation or the thickness and quality of made ground across the site may be variable. In addition, groundwater levels and ground gas concentrations and flows, may vary from those reported due to seasonal, or other, effects and the limitations stated in the data should be recognised.
11. Asbestos is often observed to be present in soils in discrete areas. Whilst asbestos-containing materials may have been locally encountered during the fieldworks or supporting laboratory analysis, the history of brownfield and demolition sites indicates that asbestos fibres may be present more widely in soils and aggregates, which could be encountered during more extensive ground works.
12. Unless stated otherwise, only preliminary geotechnical recommendations are presented in this report and these should be verified in a Geotechnical Design Report, once proposed construction and structural design proposals are confirmed.

APPENDIX B

SUMMARY OF LEGISLATION AND POLICY RELATING TO CONTAMINATED LAND

Part IIA of the Environmental Protection Act 1990

Part IIA of the Environmental Protection Act 1990 (Part IIA) and its associated Contaminated Land Regulations 2000 (SI 2000/227), which came into force in England on 1 April 2000, formed the basis for the current regulatory framework and the statutory regime for the identification and remediation of contaminated land. Part IIA of the EPA 1990 defines contaminated land as 'any land which appears to the Local Authority in whose area it is situated to be in such a condition by reason of substances in, on or under the land, that significant harm is being caused, or that there is significant possibility of significant harm being caused, or that pollution of controlled waters is being or is likely to be caused'. Controlled waters are considered to include all groundwater, inland waters and estuaries.

In August 2006, the Contaminated Land (England) Regulations 2006 (SI 2006/1380) were implemented, which extended the statutory regime to include Part IIA of the EPA as originally introduced on 1 April 2000, together with changes intended chiefly to address land that is contaminated by virtue of radioactivity. These have been replaced subsequently by the Contaminated Land (England) (Amendment) Regulations 2012, which now exclude land that is contaminated by virtue of radioactivity.

The intention of Part IIA is to deal with contaminated land issues that are considered to cause significant harm on land that is not undergoing development (see Environmental Protection Act 1990: Part 2A Contaminated Land Statutory Guidance, April 2012). This document replaces Annex III of Defra Circular 01/2006, published in September 2006 (the remainder of this document is now obsolete).

Planning Policy

Contaminated land is often dealt with through planning because of land redevelopment. This approach was documented in Planning Policy Statement: Planning and Pollution Control PPS23, which states that it remains the responsibility of the landowner and developer to identify land affected by contamination and carry out sufficient remediation to render the land suitable for use. PPS23 was withdrawn early in 2012 and has been replaced by much reduced guidance within the National Planning Policy Framework (NPPF), reference ISBN: 978-1-5286-1033-9, February 2019.

The new framework has only limited guidance on contaminated land, as follows:

Chapter 11. Making effective use of land

117 Planning policies and decisions should promote an effective use of land in meeting the need for homes and other uses, while safeguarding and improving the environment and ensuring safe and healthy living conditions. Strategic policies should set out a clear strategy for accommodating objectively assessed needs, in a way that makes as much use as possible of previously-developed or 'brownfield' land.

118. Planning policies and decisions should:

c) give substantial weight to the value of using suitable brownfield land within settlements for homes and other identified needs, and support appropriate opportunities to remediate despoiled, degraded, derelict, contaminated or unstable land.

Chapter 15. Conserving and enhancing the natural environment

170. Planning policies and decisions should contribute to and enhance the natural and local environment by:

e) preventing new and existing development from contributing to, being put at unacceptable risk from, or being adversely affected by, unacceptable levels of soil, air, water or noise pollution or land instability. Development should, wherever possible, help to improve local environmental conditions such as air and water quality, taking into account relevant information such as river basin management plans; and

f) remediating and mitigating despoiled, degraded, derelict, contaminated and unstable land, where appropriate.

Ground conditions and pollution

178. Planning policies and decisions should ensure that:

a) a site is suitable for its proposed use taking account of ground conditions and any risks arising from land instability and contamination. This includes risks arising from natural hazards or former activities such as mining, and any proposals for mitigation including land remediation (as well as potential impacts on the natural environment arising from that remediation);

b) after remediation, as a minimum, land should not be capable of being determined as contaminated land under Part 2A of the Environmental Protection Act 1990; and

c) adequate site investigation information, prepared by a competent person, is available to inform these assessments.

179. Where a site is affected by contamination or land stability issues, responsibility for securing a safe development rests with the developer and/or landowner.

Water Resources Act (WRA)

The Water Resources Act 1991 (Amendment) (England and Wales) Regulations 2009 updated the Water Resources Act 1991, which introduced the offence of causing or knowingly permitting pollution of controlled waters. The Act provides the Environment Agency with powers to implement remediation necessary to protect controlled waters and recover all reasonable costs of doing so.

Water Framework Directive (WFD)

The Water Framework Directive 2000/60/EC is designed to:

- enhance the status and prevent further deterioration of aquatic ecosystems and associated wetlands that depend on the aquatic ecosystems
- promote the sustainable use of water
- reduce pollution of water, especially by 'priority' and 'priority hazardous' substances
- ensure progressive reduction of groundwater pollution.

The WFD requires a management plan for each river basin be developed every six years.

Groundwater Directive (GWD)

The 1980 Groundwater Directive 80/68/EEC and the 2006 Groundwater Daughter Directive 2006/118/EC of the WFD are the main European legislation in place to protect groundwater. The 1980 Directive is due to be repealed in December 2013. The European legislation has been transposed into national legislation by regulations and directions to the Environment Agency.

Priority Substances Directive (PSD)

The Priority Substances Directive 2008/105/EC is a 'Daughter' Directive of the WFD, which sets out a priority list of substances posing a threat to or via the aquatic environment. The PSD establishes environmental quality standards for priority substances, which have been set at concentrations that are safe for the aquatic environment and for human health. In addition, there is a further aim of reducing (or eliminating) pollution of surface water (rivers, lakes, estuaries and coastal waters) by pollutants on the list. The WFD requires that countries establish a list of dangerous substances that are being discharged and EQS for them. In England and Wales, this list is provided in the River Basin Districts Typology, Standards and Groundwater threshold values (Water Framework Directive) (England and Wales) Directions 2010. In order to achieve the objectives of the WFD, classification schemes are used to describe where the water environment is of good quality and where it may require improvement.

Environmental Permitting Regulations (EPR)

The Environmental Permitting (England and Wales) Regulations 2016 (as amended) provide a single regulatory framework that streamlines and integrates waste management licensing, pollution prevention and control, water discharge consenting, groundwater authorisations, and radioactive substances regulation. Schedule 22, paragraph 6 of EPR 2016 states: 'the regulator must, in exercising its relevant functions, take all necessary measures - (a) to prevent the input of any hazardous substance to groundwater; and (b) to limit the input of non-hazardous pollutants to groundwater so as to ensure that such inputs do not cause pollution of groundwater.'

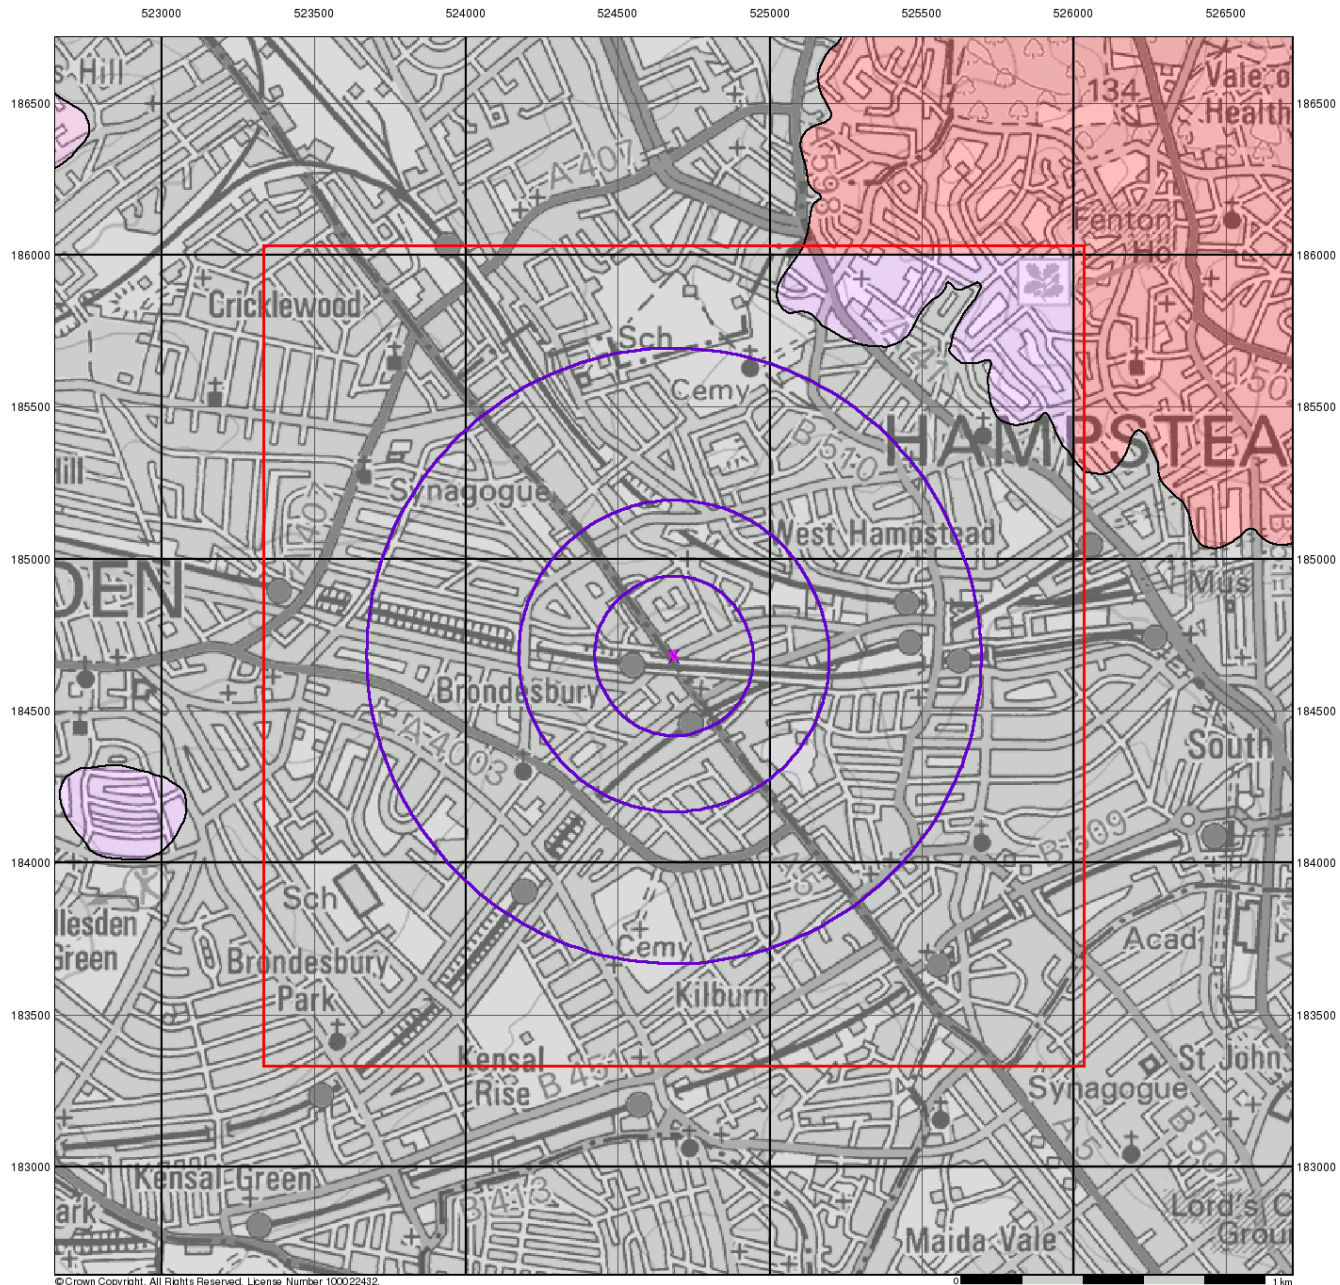

Notes:

- 1. The above information is provided for background but does not constitute site-specific advice*
- 2. The above summary applies to England only. Variations exist within other countries of the United Kingdom*

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread, and to the vulnerable targets of contamination, as it does the potential sources of contamination. For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client. In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Geology 1:50,000 Maps

This report contains geological map extracts taken from the BGS Digital Geological map of Great Britain at 1:50,000 scale and is designed for users carrying out preliminary site assessments who require geological maps for the area around the site. This mapping may be more up to date than previously published paper maps.

The various geological layers - artificial and landslip deposits, superficial geology and solid (bedrock) geology are displayed in separate maps, but superimposed on the final 'Combined Surface Geology' map. All map legends feature on this page. Not all layers have complete nationwide coverage, so availability of data for relevant map sheets is indicated below.

Superficial Geology

Superficial Deposits are the youngest geological deposits formed during the most recent period of geological time, the Quaternary, which extends back about 1.8 million years from the present.

They rest on older deposits or rocks referred to as Bedrock. This dataset contains Superficial deposits that are of natural origin and 'in place'. Other superficial strata may be held in the Mass Movement dataset where they have been moved, or in the Artificial Ground dataset where they are of man-made origin.

Most of these Superficial deposits are unconsolidated sediments such as gravel, sand, silt and clay, and onshore they form relatively thin, often discontinuous patches or larger spreads.

Bedrock and Faults

Bedrock geology is a term used for the main mass of rocks forming the Earth and are present everywhere, whether exposed at the surface in outcrops or concealed beneath superficial deposits or water.

The bedrock has formed over vast lengths of geological time ranging from ancient and highly altered rocks of the Proterozoic, some 2500 million years ago, or older, up to the relatively young Pliocene, 1.8 million years ago.

The bedrock geology includes many lithologies, often classified into three types based on origin: igneous, metamorphic and sedimentary.

The BGS Faults and Rock Segments dataset includes geological faults (e.g. normal, thrust), and thin beds mapped as lines (e.g. coal seam, gypsum bed). Some of these are linked to other particular 1:50,000 Geology datasets, for example, coal seams are part of the bedrock sequence, most faults and mineral veins primarily affect the bedrock but cut across the strata and post date its deposition.

Combined Surface Geology

The Combined Surface Geology map combines all the previous maps into one combined geological overview of your site.

Please consult the legends to the previous maps to interpret the Combined "Surface Geology" map.

Additional Information

More information on 1:50,000 Geological mapping and explanations of rock classifications can be found on the BGS website. Using the LEX Codes in this report, further descriptions of rock types can be obtained by interrogating the 'BGS Lexicon of Named Rock Units'. This database can be accessed by following the 'Information and Data' link on the BGS website.

Middlesex
Published 1873 - 1874
Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.
