

## First Fix Method Statement

As per our previous method statement, across floors we will aim to run first fix between joists and where possible use pre manipulated notches in joists if required. We will notch as few as possible joists to minimize any disruption to the existing fabric of the building. Where we need to notch, we have provided previously details on how we will carry out this work, but will aim of course to do it in the most sensitive method possible to the historic fabric of the building.

Between floors, we will run first fix throughout using existing routes where possible. Where additional areas are required for first fixing to carry out the proposed plans and no existing path is available, we will use the small voids in our proposed plans in the bathroom areas on the two walls designated and behind one kitchen area only to run the main routes between the floors for cabling and piping.
