# glazing channel

Our range of frameless glass balustrade are extremely versatile and is suitable for a variety of installations and fixing requirements. There are four Glazing Channel profiles available which are two base mount fixing options and two side mounted designs. This versatility leads to extra flexibility in reaching the most suitable solution for bespoke installation and design requirements.

## **BASE MOUNT "U SHAPE" - MODEL 6010 :**

The most popular and versatile member of the Glazing Channel Family. The profile is not only cost-effective, it is actually the mother of all profiles, with the fixing points hidden within the channel profile.

## **BASE MOUNT "F SHAPE" - MODEL 3010 :**

One of the most powerful glazing channel products in the 0.74kN application range. This model is very well suited for balconies and terraces - it enables an especially small edge distance and therefore gains valuable additional space on the deck itself. Moreover this system is ideally suited for new installations under screed. The relevant distances between drill holes have been taken into account.

## **SIDE MOUNT "U SHAPE" - MODEL 6011 :**

Intelligent solution for side mounted glazing applications. Developed for easy installations into steel or concrete. Suitable for avoiding the need to break waterproof linings and screed of roofing and balconies. Cover strips available to give a seamless finish to the profile, hiding the fixing holes present in the channel.

## **SIDE MOUNT "Y SHAPE" - MODEL 3011 :**

One of the most flexible glazing channel products in the 0.74kN application range. This model allows for side fixing at a lower level. Ideal for flush glazing when installing against thick roof insulation or a deck structure, while obtaining a structurally sound fitted solution. The height adjustment option makes installation very easy with additional flexibility.
