Proposed Green Screen System

Advice has been taken on the best species to plant to the South Elevation of the property and it appears we are quite limited with what is likely to survive in this location. We therefore propose the Hedera Helix Woerner as this is hardy but non-invasive. This particular variety of ivy winds rather than adhering to the wall.

The proposal is for 3x green screens each measuring 1220mm wide x 1800mm high. Each screen will be in a self-contained planter measuring 1440mm wide x 400mm deep and 400mm wide. The screens are fully grown giving full coverage at the point of installation. Irrigation will be provided from the adjoining water butt and maintenance will be trimming back the ivy twice a year.
