

1 Works to remove existing asphalt/concrete in preparation for foundations/resurfacing requires minimisation of noise and dust, together with enforced limitations on the use of percussive breakers for operatives.

Use of water borne dust suppression measures required - water cooled diamond saws should be used wherever possible. Acoustic barriers must be installed adjacent to works and periods of noisy activity notified to the site management one week in advance of the works taking place.

Exact location of water, waste and electrical services must be determined prior to cutting or breaking activity taking place and evidenced using clear markings.

No gas pipework is live on site however some gas may be present in redundant pipework from the former installation.

2 Site access points across public pavement requiring dedicated operatives to manage vehicle access and all deliveries - note narrow access and vulnerable building details to be protected during works
