GLA Carbon Emission Reporting Spreadsheet

BACKGROUND AND PURPOSE

The GLA has decided that from January 2019 and until central Government updates Part L with the latest carbon emission factors, planning are encouraged to use the SAP 10 emission factors for **referable applications** when estimating CO₂ emission performance against London Plan policies. This is a new approach being taken by the GLA to reflect the decarbonisation of the electricity grid, which is not currently taken into account by Part L of Building Regulations. This approach will remain in place until Government adopts new Building Regulations with

This GLA Carbon Emission Reporting Spreadsheet facilitates the use of the SAP 10 emission factors and ensures a consistent and transparent process for updating Part L 2013 CO_2 emission performance. In particular, the approach has been developed to ensure that SAP 10 results can still be validated against supporting Part L 2013 BRUKL and SAP outputs.

From January 2019 all GLA referable applications (including refurbishments) are expected to use this spreadsheet to report the anticipated carbon performance of a development. This includes planning applicants who are continuing to use SAP 2012 emission factors; although doing so will need to be supported by sufficient justification in line with the Energy Assessment Guidance. Applicants are required to submit this spreadsheet to the GLA alongside the energy assessment. It should be used for both domestic and non-domestic uses. The GLA will not accept the use of alternative methodologies or tools. This is to ensure consistency and to minimise the need for clarifications during the determination

Planning applicants should use Part L 2013 BRUKL and SAP outputs to fill in this spreadsheet which serves as a the final step in reporting the carbon emission performance of the proposed energy strategy. It is solely for the purpose of reporting to the GLA and does not replace Part L calculations submitted for Building Regulations approval.

The spreadsheet has been developed to fit as wide a range of policy compliant approaches for referable schemes as possible. Any planning applicants with a policy compliant approach that the spreadsheet does not serve should contact the GLA at: environment@london.gov.uk. Applicants must not amend or alter the spreadsheet to suit non-policy compliant strategies. Any unauthorised amendment to the spreadsheet will invalidate the CO₂ emission calculations.

Applicants should note that we will update the spreadsheet from time to time to ensure it remains fit for purpose. Applicants are expected to use the latest version at the time of the planning submission

Any feedback on this spreadsheet should be sent to: environment@london.gov.uk.

Applicants are required to complete all light blue input cells in the applicable tabs ('Carbon Factors', 'Baseline', 'Be Clean', 'Be Clean 'Be Green' and 'GLA Summary Tables')

For all applications, the input data required includes:

Bespoke Carbon Factors (if applicable)

- Type of units modelled
- Area of units modelled (m²)
- · Number of units modelled
- Total area represented by model (m²)
- Regulated energy consumption by end use (kWh p.a. for residential and kWh/m² p.a. for non-residential)

- Regulated energy consumption by flue type (kWh/m² p.a. for non-residential and kWh/m² p.a. Regulated energy consumption by flue! type (kWh/m² p.a. for non-residential)

 TER, DER and BER figures (kgCO2/m² p.a.)

 TFEE and DFEE figures for residential (kWh/m² p.a.)

 Regulated energy demand figures (kWh p.a. for both residential and non-residential)
- Unregulated gas and electricity consumption figures (kWh p.a. for both residential and non-residential) fin the 'GLA Summary tables' tab only!
- Actual and notional building cooling demand (MJ/m²) [In the 'GLA Summary tables' tab only]

Applicants should update the highlighted cells with the type, area and number of modelled units. The consumption figures (kWh p.a. for domestic and kWh/m² p.a. for non-domestic) from the Part L modelling output reports should be reported and used to estimate the CO2 emissions for each stage of the Energy Hierarchy. The TER, DER and BER figures from the Part L 2013 modelling output sheets should also be reported for crossreference purposes. The applicant should ensure that the manually calculated TER, DER and BER figures are equal to the figures reported within the output sheets. TFEE and DFEE information should also be provided as well as unregulated uses consumption, energy demand figures and cooling demand performance.

The total carbon emissions figures in the 'GLA Summary tables' tab are now calculated based on the area input for 'Total area represented by model (m²). This input requirement has been added to ensure that the carbon emission figures align with the development area schedule (included within the DAS) rather than the number of representative models.

Required Part L Outputs for the GLA spreadsheet

Domestic Part L Outputs:

For the domestic conversion applicants are required to use the outputs from the SAP TER and DER worksheets. To assist in the conversion process the required SAP worksheet rows have been referenced in each input cell. For Space Heating and Hot Water applicants will be required to manually convert the SAP energy requirements to energy consumption by fuel type, the appropriate SAP rows for this calculation have also been listed. **Note.** The SAP worksheet rows are based on a communal heating system, which is an expectation for GLA referrable schemes. Applicants proposing individual systems must first seek confirmation from the GLA as to whether the approach will be acceptable. Non-domestic Part L Outputs:

The required Part L outputs from non-domestic modelling will be energy consumption by fuel type (e.g. grid electricity, natural gas). The energy consumption by end use (e.g. heating, hot water, cooling etc.) included in the BRUKL documents are no longer used to estimate the CO₂ emission performance with SAP 10 emission factors in this spreadsheet. This decision has been taken as the consumption figures provided in the BRUKL may include a mixture of fuel types, for instance heating may include energy consumption from gas boilers and electrically driven heat The required data can be found in:

- pumps. The required data can be round in:
 SBEM software: the required data is included in the output file ending "*sim.csv"

 "SE" and TAS): the required data is included. · Government approved software (such as IES and TAS): the required data is included in the output file ending in "*BRUKL.inp"

The above output files should be appended to the energy assessment document

Regarding the non-domestic uses, the applicant can determine whether each individual unit will be modelled independently and apportioned to the entire scheme or whether a single model will be generated for the entire development. The applicant should, however, include the results from all BRUKL outputs generated for the proposed development under the "NON-DOMESTIC ENERGY CONSUMPTION AND CO2 ANALYSIS"

Note: GLA are aware that the Part L outputs for grid supplied electricity consumption does not account for power factor correction. Where power factor correction is present applicants may be required to amend the electricity consumption by the appropriate adjustment factor. The power factor correction is found in Table 1 of the Government's Approved Document L2A (ADL2A). Applicants should note in the appropriate cells where power factor correction has been applied

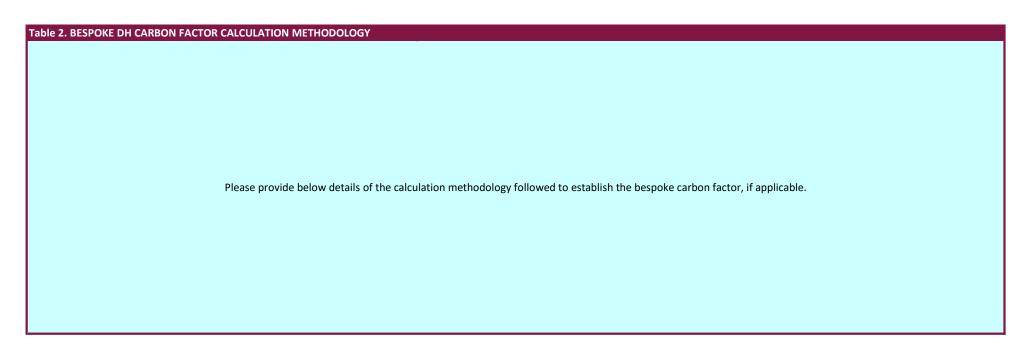

Carbon Factors

The carbon factors for SAP 2012 and SAP 10 scenarios have been provided in the 'Carbon Factors' tab. The table has been pre-populated with grid electricity and gas factors. Additional space has been included for alternative fuel factors that are included in Table 12 of the SAP 2012 and SAP 10 methodology document. For applications with non-domestic buildings connecting to external heat networks a bespoke carbon factor needs to be introduced, the applicant should provide the full calculation behind the introduced bespoke carbon factor.

Validation Check

A validation check is required for each model entered to ensure that the conversion is robust. Applicants must ensure that the calculated TER/DER/BER in this spreadsheet matches the actual values from the Part L 2013 BRUKL and SAP worksheets

Table 1. CARBON (CO ₂) FACT	ORS		Notes
Fuel type	Fuel Carbon Fac	tor (kgCO2/kWh)	
	SAP 2012	SAP 10	
Natural Gas	0.216	0.210	SAP 2012 and SAP 10 carbon emission factors (Table 12).
Grid Electricity	0.519	0.233	
Waste Heat From Power Stat	0.058	0.015	These factors should be used where alternative fuel is used to grid gas and electricity. Carbon emission factors used here
Enter Carbon Factor 2			must be taken from Table 12 within the SAP 2012 and SAP 10 documents.
Enter Carbon Factor 3			
Enter Carbon Factor 4			Fuel type should be updated and referenced in Column A when additional carbon factor values have been added.
			This should only be used for non-domestic buildings that are connecting to District Heating (DH) networks. The network
			carbon factor should be calculated in line with Part L requirements and a seperate factors should be provided using SAP
Bespoke DH Factor			2012 and SAP 10 fuel factors. Assumptions and workings should be shown below in Table 4.

Issue	1.1
Date	10/01/2019
Author	Greater London Authority

Update Location	Description of changes made to GLA Carbon Emission Reporting Spreadsheet
Introduction /	Additional explanatory wording has been included in the 'Background and Purpose' and
Version Control	'Methodology' sections to further assist applicants with the reporting process
	A version control tab has been added to list all changes made to the spreadsheet under separate
	versions
Baseline, be lean, be	Domestic
clean & be green	SAP worksheet row reference numbers have been included in the input tabs
tabs	Non-domestic
	Non-domestic calculation is now based on 'energy consumption by fuel type' instead of the
	consumption figures in the BRUKL tab to enable the accurate calculation of the TER/BER figures.
	This data is available in the output file ending in "*BRUKL.inp" for government approved software
	and output file ending "*sim.csv" for SBEM. Where these files are used they should be appended
	to the Energy Statement.
	Total calculation is now based on the 'total area represented by model (m²)' rather than the 'number
	of units'. This is to ensure that the total model area aligns with the development area schedule.
	Rows with void formulas have now been fixed
	Formula for OUD/Decretable contribution was first in CAD 40 coloulation
	Formula for CHP/Renewable contribution now fixed in SAP 10 calculation
	Extra input rows have been added to account for larger schemes
	Extra input rows have been added to account for larger scriemes
	Columns used to calculate the carbon emissions using SAP10 carbon factors have been unhidden
	to allow for greater transparency in the calculation methodology
	Validation check moved to be more prominent
	Additional heat source has been added into the calculation
	Reporting of electricity generated by CHP or renewable technologies has been changed; this
	should now be inputted as a negative value (-)
	Additional heat source has been added into the calculation in the 'be green' tabs to account for
Be Green tab	multiple heating systems, if present
Carbon factors tab	The carbon emission factor table has been updated and clarification has been provided on how
	they should be used
	A typo in the carbon factor unit has been corrected (kgCO ₂ /kWh)
